Sixty five checks, and nine switches

A model that only works one way has not been tested. The workbook compares itself in sixty five places and fails loudly when two tabs disagree, and nine switches turn whole parts of the plan off so a reader can test it in about a minute rather than argue about it.

65
CHECKS THE WORKBOOK RUNS AGAINST ITSELF

10
READING PASS ON THE CHECKS TAB

2
READING REVIEW, BOTH BY DESIGN

9
SWITCHES, AND ONE SCENARIO SELECTOR

1 The twelve checks on the dedicated tab

No.	What is being checked	Result
1	Cash reconciles to the profit and loss	PASS
2	Operating expenses tie to their five parts	PASS
3	Team cost on two tabs agrees	PASS
4	Revenue ties to its parts	PASS
5	Delivery capacity covers the ramp	PASS
6	Runway at the seed decision	REVIEW
7	Every year end balance is above zero	PASS
8	Pre-seed tranches tie to the capital raised	PASS
9	Grants tie to their schedule	PASS
10	Month by month cash agrees with the yearly cash	PASS
11	Cost of revenue ties to the component build	PASS
12	No month inside a year is overdrawn	REVIEW

Legend. **PASS** means the two tabs agree to the dollar. **REVIEW** means nothing is broken but a threshold the plan sets for itself has been crossed and somebody should look. **FAIL** would mean two tabs that must agree do not. Fifty four further checks sit inside the sheets that produce the figures, each one naming what it compares and what a failure would mean.

The two that read REVIEW, and why neither is a defect

Both are numbers the plan already states out loud. A check that reads REVIEW is a threshold crossed, not an error.

Runway at the seed decision	Three other tabs call twelve months of cash the warning threshold for starting a raise. This is the only place in the workbook that enforces it, and it reads REVIEW because the plan walks into the round with **1.1 months** of cost in hand. That is a scheduling fact rather than an arithmetic failure, and 05.8 carries what to do about it.
No month inside a year is overdrawn	Check seven reads six year end balances and passes. A year that ends above zero can still contain a month with nothing in the account, and this plan contains **eight** of them. This check reads the month by month build rather than the annual one, which is why it is the most important signal in the workbook.
What would count as a defect	A FAIL. Two tabs that must agree not agreeing, an operating expense line added without the total following it, a revenue line counted twice, or the monthly cash build not reconciling to the annual statement. None of those reads FAIL on this build.
What the earnings margin check is for	It flags that the cost base has not been rebuilt for six revenue lines. While it reads REVIEW, the earnings margin looks good partly because revenue rises faster than the cost model behind it, and it should not be quoted as a target.

2 The nine switches, and what each one is set to

No.	Switch	Setting
1	1	on
2	2	on
3	3	on
4	4	on
5	5	on
6	6	on
7	7	off
8	8	on
9	9	off

Legend. One means on and zero means off. Two of the nine ship off: development is expensed rather than capitalised, so nothing is amortised and the earnings line is not flattered, and the borrowing facility is not drawn, so every figure in this folder is the harder version of the plan.

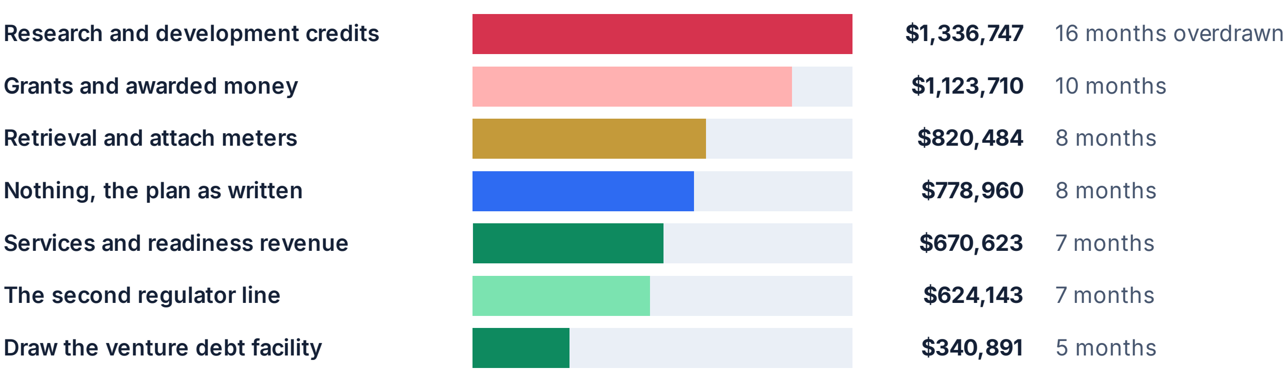
What happens when you switch parts of it off

Each row was produced by throwing one switch and recalculating every tab. Every case is free of formula errors and every internal check still holds.

Turn this off	Lowest month on the road	Months overdrawn	What it proves
Nothing, the plan as written	($778,960)	8	The base case
Grants and awarded money	($1,123,710)	10	The plan does not depend on money nobody has awarded
Research and development credits	($1,336,747)	16	The largest single dependency in the plan
Services and readiness revenue	($670,623)	7	Services are not carrying the road to the seed
The second regulator line	($624,143)	7	The least evidenced line improves the road when it is removed
Retrieval and attach meters	($820,484)	8	The meters are additive rather than structural
Draw the venture debt facility	**($340,891)**	**5**	**The facility narrows the gap and does not close it**

Legend. Negatives in parentheses. The lowest month is the low point on the monthly road, which runs from the pre-seed close to two months past the seed. Source: the master pro forma, each case recalculated in full.

3 Which assumption the plan actually leans on



Bars start at zero and are the depth of the low point on the road to the seed, so longer is worse. Two rows sit below the base case: switching the second regulator line off **improves** the road, because the line carries cost before it carries revenue, and drawing the facility improves it by design.

On this build the answer is the research and development credits.

That is printed here rather than discovered later. It is also the least discretionary of the dependencies, because the credit follows eligible engineering pay that the plan is spending anyway.

Where the numbers come from

Every material figure is traced to a named source or marked as a management estimate. Nothing sits in between.

Class	What it means	Examples in this plan
Verified	A named public source that was read	The register of payment service providers, the regulator's own estimate of entities in scope, the corporate tax rates, the research credit and the Alberta grant, the published salary surveys
Estimated	A management assumption, named as one	Canadian dollar stablecoin issuers, property management brokerages, firms performing independent reviews, the budget qualified share of each tier
Benchmark	A published figure for companies of this size	Spending benchmarks at three to five million of revenue, retention benchmarks, audit and penetration test costs, payback and magic number thresholds
Model	**Our own workbook, recalculable by anybody holding it**	**Every revenue, cost, cash and return figure in this folder**

Legend. The source register on the workbook's own tab names the publisher and the date for each row. Where no published Canadian figure exists, the plan says so rather than reaching for the nearest thing: the share of firms carrying a second regulated duty is the clearest case, and the line that rests on it is quoted switched off.

4 How to test this plan in ten minutes

Open the checks tab first	Ten PASS and two REVIEW. If anything reads FAIL, stop reading the documents and ask what changed, because a figure somewhere has been edited by hand.
Throw the switch you least believe	Grants, the second regulator, the meters, the services. Each one recalculates the whole model, and the low point on the road is the number to watch.
Change the customer count	New logos are the only customer figures typed anywhere. Halve them and every revenue, cost and cash figure in this folder moves with them.
Then argue about the price	It is the least consequential of the four. The smallest tier carries three quarters of the customers and a fifth of the money, so a fifth off its price costs 4.7 per cent of 2031 revenue.
