

Twenty nine months, and the eight that are overdrawn

A year that adds up can still contain a month with nothing in the account. This document runs the plan month by month from the first cheque landing to two months past the round, with revenue phased on customers live rather than spread flat and cash collected on forty five day terms.

THE LOW POINT WITH
THE FACILITY DRAWN

\$4.6M

CASH WHEN THE ROUND
CLOSES, OCTOBER 2028

1 Closing cash, every month from the pre-seed close

Columns are the closing balance in each month, above and below a zero line. Blue is in credit, red is overdrawn. The eight red months are February 2027, then February to August 2028 in a row. The round closes in October 2028, which is the column that takes the balance to **\$4,567,520**. Source: the master pro forma, monthly road to the seed, which reconciles to the annual cash statement to the dollar.

What the road looks like, quarter by quarter

The same twenty nine months, grouped, with what happens to the balance and why.

Period	Customers live	Revenue earned	Cash in	Closing cash	What happens
Aug to Dec 2026	0	\$0	\$1,050,000	\$581,835	Two instalments land. The build runs and no customer pays
Q1 2027	16	\$298,456	\$500,000	\$210,260	First paying customers. February goes overdrawn by \$40,667
Q2 2027	32	\$746,139	\$500,000	\$261,498	The last pre-seed instalment lands in May
Q3 2027	49	\$1,193,823	\$0	\$260,419	No capital in. The balance holds near \$250,000 on collections alone
Q4 2027	65	\$1,641,507	\$0	\$707,024	The strongest quarter before the round, at \$707,024
Q1 2028	108	\$2,622,095	\$0	\$-575,999	The cost base steps to \$1,035,882 a month and the balance turns
Q2 2028	152	\$3,832,664	\$0	\$-678,680	The low point, \$778,960 down in May
Q3 2028	195	\$5,043,232	\$0	\$429,209	Collections catch the cost base and the balance recovers
Q4 2028	238	\$6,253,801	\$3,500,000	\$6,247,665	The round closes in October

Legend. Revenue earned is what the company has a right to in the period. Cash in is capital only. The gap between the two is why a profitable year can still contain an overdrawn month: revenue is invoiced and collected forty five days later, and the cost base steps on 1 January.

2 The two months worth diarising

February 2027, the first overdrawn month

The account closes \$40,667 down, a single month, between the third and fourth pre-seed instalments. It is small enough that a week of collection timing fixes it, and it is shown rather than netted out of the quarter.

May 2028, the low point

The account closes **\$778,960** down, in the seventh of eight consecutive overdrawn months. Every option for closing it is on the next page, and the cheapest one costs about \$90,000 and no ownership.

Why the account goes overdrawn, in three sentences

None of the three is a surprise. All three are timing.

The cost base steps at the start of 2028, and the revenue does not	Monthly cost goes from \$348,270 to \$1,035,882 on 1 January, because the team, the build and the delivery capacity all have to be in place before the customers they serve arrive. Revenue in January 2028 is \$739,524.
Revenue is collected forty five days after it is earned	So the January cost meets the November revenue. Across the six years the receivable takes \$12,979,145 of cash that the profit line has already recognised.
No capital lands between May 2027 and October 2028	Seventeen months. The last pre-seed instalment arrives in May 2027 and the round closes in October 2028, and the eight overdrawn months sit inside that gap.

3 What closes the gap, and what each option costs

Option	What it does to the low point	What it costs
Draw the \$500,000 facility	Narrows it to (\$340,891) across five months	About \$90,000 of interest over twenty seven months, and nothing in ownership. Repaid out of the round
Raise a sixth instalment	Closes it outright	Two and a half per cent of the company permanently, worth \$750,000 at a \$30,000,000 round
Slow the hiring plan	Closes it, and moves the customer ramp with it	The delivery capacity headroom is what pays for this, and it is the one thing the plan cannot recover later
Bring the round forward	Closes it	Prices the round off 2027 rather than 2028, at \$8.4M rather than \$30M post-money. The most expensive option on the page

Legend. The facility is the recommended path and it is switched off in every figure in this folder, so a reader is looking at the harder version of the plan rather than the smoothed one.

This is the most important number in the workbook.

It is the one an investor should test first, and it is printed on the face of the model rather than in a footnote. The workbook carries a check that reads REVIEW until the account is above zero in every one of the twenty nine months.
