

The build partner, and what is actually signed

4orm Finance does not employ engineers. The software is built by Speer Technologies under a phased statement of work, with a named bench rather than a promised capacity. This document is what 4orm Finance says about that arrangement. Speer's own portfolio sits beside it in this folder.

DAILY USERS ACROSS THOSE PLATFORMS

1 The firm, in four lines

Who they are

Speer Technologies Inc., incorporated under the laws of Canada, at 379 Shuter Street in Toronto. Software development, cloud infrastructure, data systems, patent work and product engineering. Two offices in Toronto and one in New York, twenty five people at the time of the 2024 Globe and Mail list.

What they are engaged to build

The evidence store, the daily reconciliation, the rule store and the screens, against our architecture pack. Three phases, each with a defined deliverable, a written test and a one month termination right without penalty.

Why a partner and not a hire

A team of the size this build needs would take six to nine months to hire and would carry salary from the first month. Speer starts on signature and stops on completion, which is why the plan reaches a working product on a pre-seed rather than needing a seed to begin.

What is signed today

A letter of intent. It converts to a final agreement on the deposit, and the assignment of the intellectual property to 4orm Finance forms part of that final agreement. Until the deposit is paid, what exists is the letter of intent and nothing beyond it.

What this document does not claim.

Speer is a supplier. It is not a shareholder, an investor or a party to the round, and nothing on these pages is a statement by Speer about 4orm Finance. Every figure about Speer here comes from Speer's own portfolio and partnership documents or from the Globe and Mail, and none of it has been independently audited.

The bench, by name and by face

Ten seats across product, engineering, protocol, infrastructure, security and cryptography.

Nine carry a name in Speer's own partnership document and the tenth is the lead design role.

 Diego Castro Director of product	 Karan Agrawal Director of engineering	 Sid Bounadji Engineering manager	 Jad El Kassar Protocol engineer	 Harley Lovitos Smart contract architect
 Mike Glover Internet of things and infrastructure	 Eric Shin System integration engineer	 Doug Sutherland Blockchain protocol advisor	 Ahmed Nassri Security and cryptography advisor	 Product designer Lead user experience and interface strategy

Names, faces and titles exactly as they appear in the Speer partnership document. A bench that is named can be checked, and a bench described as capacity cannot. Speer staffs from a training pipeline with named institutions, among them the University of Toronto, Toronto Metropolitan, Guelph, Windsor, York, Seneca, BrainStation, Lighthouse Labs and the DMZ, which is how a firm of this size staffs a build without a hiring cycle.

2 What the bench does and does not touch

What the build partner writes	The pipeline, the interfaces, the integrations and the operational plumbing. The majority of the code, and the reason the plan reaches a working product inside the pre-seed.
What only a senior hand may touch	The evidence store, the two dates and the submission binders. Those layers are owned by the engineering lead the round funds and are not delegated to the build partner, whatever the schedule pressure.
Who signs a rule	The regulatory lead, who authors and signs every rule release and cannot deploy code. A developer must never make a regulatory decision, and neither must a model. That separation is a control an outside reviewer can test.
Why this matters to build risk	A pre-seed company usually carries the question of whether the team can ship. This bench has shipped for a national airline, a chartered bank and three of the largest retailers in the country. That is a claim about who holds the tools, not a claim about 4orm Finance.

What this bench has already delivered

Ten engagements from Speer's own portfolio, with the length of each one and what was built. The two that matter most to this build are the first two.

Partner	Sector	Length	What Speer built
Grata	Property management	Five years	Moved the team from offshore to local and built the platform serving more than sixty thousand residents: iOS, Android, web, and the smart lock hardware
Netcoins	Regulated crypto trading	Two years	Platform architecture and backend work as trading volume grew, and a redesign of the trading flows
TD Bank	Chartered bank	Two years	Software that digitises legal documentation through advanced scanning
GreenShield	Insurance	Two years	Designed and implemented a new member services platform alongside Deloitte
Air Canada	Commercial airline	One year	Platform and interface work for the country's largest carrier
DEA Aviation	Airborne surveillance	One year	A control panel showing live aircraft position, route and mission status
OnPath	Fleet and asset management	Five years	A platform reading vehicle devices for health, driver behaviour and risk
Seity Health	Workplace psychology	Two years	Engineering and design, including a mental health assessment application for Pfizer
DIMO	Connected vehicle data	One year	Rebuilt the application and its device communication after investors flagged that drivers struggled with it
IKEA	Home furnishings	One year	The depth sensing and spatial mapping behind the IKEA Place experience

Legend. Every row is from Speer's portfolio, August 2026, and none of it has been independently verified by 4orm Finance. Grata matters because property management is one of the buyer groups on our own register. Netcoins matters because a regulated Canadian crypto trading platform is a 4orm Finance buyer, so the build partner has already worked inside the operating reality of a customer we intend to sell to.

3 The rest of the client list, as published

COSTCO	ROGERS	TELUS	MCDONALD'S	UNILEVER	CARRIER	OXFORD PROPERTIES
OMNICOM	WINMAGIC	HARRISON HEALTHCARE	BAKER HEALTH	MANZIL	GRIDTRACTOR	
CAREPOOL	PROLINK	TIDAL				

Speer's published partner list, and not an endorsement of 4orm Finance.

The engagement, and what it costs

Three phases, published hourly rates, a fixed payment schedule and a one month termination right at every stage. The structure is what protects 4orm Finance.

Phase	Fee	Hours and duration	What it produces
1, discovery and architecture	\$20,600 to \$31,200	160 to 240 hours over one to two months	Requirements, stakeholder discovery, journey mapping and a requirements document defining scope, priorities and success criteria before engineering begins
2, design and development	\$62,400 to \$93,600	480 to 720 hours over three to five months	A functional build of the core pipeline, validated against real institutional workflows and integrations
3, continued development	\$104,000 to \$156,000	800 to 1,200 hours over three to six months	Expansion to a production ready platform with the operational, compliance and security frameworks institutional adoption requires

Legend. Rate card: engineering manager \$150 an hour, senior user interface designer \$140, full stack engineer \$130, protocol engineer \$100. Engineering cost of \$187,000 to \$280,800 before tax across seven to thirteen months. Amendable by mutual written agreement and terminable by either party on one month's written notice, without penalty.

4 The money, and the four things to settle before any of it moves

Item	As written in the statement of work	What has to happen
The deposit	Twenty five per cent, \$79,326, with the balance in twelve equal instalments of \$19,831.50	The deposit is twenty five per cent of the tax inclusive upper bound. Priced on the lower bound, and at the Alberta tax rate, the same twenty five per cent is \$49,088
The notice of intent	Ten per cent, \$31,730.40, refundable, deducted from the deposit if the partnership proceeds	Only pay it if further discovery is actually wanted. It is refundable, and it is the cheapest way to hold the bench
The sales tax	Thirteen per cent harmonised sales tax, \$24,310 to \$36,504	That is the Ontario rate for the supplier. 4orm Finance is Alberta incorporated, and place of supply rules for services supplied to an Alberta recipient will generally attract five per cent instead. On the upper bound that is roughly \$22,000, and it should be confirmed with the accountant
The deliverables and the dates	Written against a tokenized real world asset platform, on a timeline running April 2026 to April 2027	Both are stale. The scope is the compliance and evidence engine, and the deliverables are being rewritten against it before any deposit is paid. The phase structure, the rate card and the termination terms are unaffected

Legend. This is a scoping exercise rather than a renegotiation. The statement of work predates the current build specification, which is the single most important thing to know about the document sitting beside this one in the folder.

What else the partnership carries

The partnership document sets out seven options beyond the build. One is already being used, two are useful and free, and the rest are conversations with nothing agreed.

Option	Where it stands	What it actually means
A, fractional technical leadership	In force in substance	Mathew Mozaffari stands in as technical chief while the build runs. This is the option that is already being used, and it is the reason the company carries a technical seat without carrying the salary
B, grants and non-dilutive money	Not counted anywhere	Speer says it has raised \$8.75 million of subsidies and grants for partners. The plan carries the Alberta grant and the research credit on its own evidence, and 05.11 shows the plan with every grant line switched off
C, money from Speer	Nothing agreed	Speer may from time to time put its own money into a partner. No amount, instrument or date exists, and no Speer money is in the capital structure
D, hiring and talent	Useful, and free	Access to hackathons of more than two hundred participants and to events at their offices. The engineering lead the round funds has to come from somewhere, and this is one of the places to look
E, patent work	Relevant, and timed	Speer says it has twenty five patents received for solutions it developed. The application on the evidence store is in preparation with counsel and the filing is deferred, so this is a conversation for the first quarter of 2027 and not now
F and G, curriculum and co-created work	Nothing agreed	A place on their preferred vendor list for speaking and curriculum, and a framework for jointly created tools. Any co-created work would need its own written agreement before anything is built

Legend. Nothing in this table is committed by either party, and nothing in it carries revenue, cost or dilution anywhere in the plan. It is listed so that a reader of the partnership document knows which parts of it are live and which are not.

5 The two things this partner is being held to

The intellectual property assignment, on the deposit

Every line produced from the day it is written belongs to 4orm Finance. This is the condition the final agreement turns on, and it is the reason the deposit and the final agreement happen on the same day.

A senior only layer that stays in house

The evidence store, the two dates and the submission binders are the engineering lead's, not the build partner's. A partner who builds the whole thing including the part a reviewer reads first is a dependency rather than a supplier.

A named bench, a phased fee and a one month exit.

That is the whole of the arrangement. It is re-decided at every stage rather than committed once at the start, and the round funds an engineering lead so the dependency shrinks as the build runs rather than growing with it.
