

Software that proves it, every morning

A Canadian business holding money for its customers has owed a daily proof since 8 September 2025, and at almost every firm the work is done by hand in a spreadsheet. 4orm Finance performs that proof, keeps it, and produces it under the rule that applied on the day.

WAYS TO CHANGE A
STORED RECORD

1 The duty, in five steps, and where it goes wrong

Money comes in	A customer's pay, deposit, retainer or refund arrives at a business holding it for them.
It is not the firm's money	It sits in an account of its own, apart from the money the business owns.
Prove it daily	What the firm says it owes each customer, against what the bank actually holds.
Keep the proof	Dated, signed by a named person, and stored so it cannot afterwards be changed.
Show it later	A reviewer asks about a day twenty months gone, and the answer has to arrive intact.

Steps one to three are the duty every firm knows about. Steps four and five are where it goes wrong.

2 What is on the subscription

1 The evidence store Records go on the pile, keep their date, and stay as they were. A correction names what it replaces.	2 The time model When the thing happened, and when we were told. A decision made in 2026 still reads under the 2026 rule in 2029.	3 Reconciliation and cases The daily comparison of the two lists, and the file that follows a gap until it closes.
4 The obligation library Every duty held as dated content, so a second regulator is content, not a code change.	5 Submission binders The pack a reviewer asks for, built from records already held, in the shape the regulator publishes.	6 Retrieval with citation An answer arrives with the records behind it attached. It cites and never decides.

Three claims, and how a reader tests each one

Every claim below can be checked against any vendor in this category, which is why they are written down rather than described.

The claim	How it is tested, without trusting us
A stored record cannot be changed or deleted, and a correction stands beside the record it replaces rather than over it	Export a month. Export the same month again a year later. Compare the two. The same bytes, or the claim is false
The system can say what was held on a named past day, under the rule that was in force on that day	Name a day before a rule change and ask for it. The answer should carry the old rule version, not today's
One build carries a second regulator, so the tenth customer costs no more to serve than the first	Hand a new duty to the person who owns the rules and watch whether it goes live without a builder, a ticket or a code release

Legend. The mechanism behind the evidence store is held back from this tier of disclosure, and an application covering it is in preparation with counsel. Nothing above depends on knowing how it is built.

3 The build order, and why it is the opposite of the usual one

The two layers a customer never sees are the two that cannot be added afterwards at any price, so both are finished before the first screen is drawn. The screens are held to a fixed set of five, so the usual squeeze at the end has nothing left to take.

4 How it is built, and where it runs

Canadian residency by design	Stored and processed in Canada, on infrastructure the customer controls, with customer isolation documented rather than asserted. Several platforms a Canadian firm could otherwise buy are ruled out on residency before price is discussed.
Integrity manifest	Hashing, timestamps and a verification workflow, so a package handed to a reviewer can be proven to be the package that was made.
Independent security review	External penetration testing and architecture review, funded at \$30,000 a year from 2028 and never run by the team that wrote the code.
Six service lines beside it	Implementation, historical migration, FINTRAC readiness, remediation, examination response and connectors. Four do not repeat.

We read the money. We never touch it.

4orm Finance is not a bank and holds no customer funds. It signs no filing on a customer's behalf and decides nothing for the customer. The duty stays with the firm that holds the money, and so does the signature. What this document does not prove: it describes a build rather than a running system, and the re-export test needs a year of records behind it.
