The Incumbent Models

Aveni, Drata and MorganAsh as benchmarks for 4orm Finance.

CONTENTS

Three companies worth copying, and the proof each one owes us.

Aveni is our first model. Drata provides the strongest commercial benchmark for recurring evidence software. MorganAsh shows how structured consumer understanding becomes a useful business workflow.

These businesses have deployed products, customer adoption and operating benefits in adjacent markets. They help us choose what to build and how to sell it. 4orm's proposed combination still needs its own customer and outcome evidence.

What the evidence supports.

Real revenue is established for Drata. Aveni provides funding, deployment and customer-efficiency evidence. MorganAsh provides product, pricing and named-use evidence; its revenue and growth rate were not verified. We should not present all three as proven high-growth revenue peers.

01 · COMMERCIAL EVIDENCE

Businesses pay for specialised evidence software.

US$100M

annual recurring revenue reported by Drata, February 2025

The comparison that follows separates revenue, fundraising, adoption and customer benefits, so a reader can see what each number establishes and what it does not.

KEY TAKEAWAYS

- Funding is capital raised, not sales. Customer counts use different definitions.
- Aveni's award entry describes a minimum growth eligibility criterion, not its exact growth rate.
- Drata's 2026 growth percentage cannot be applied to its earlier milestone to manufacture a current figure.

All links reviewed September 2026. Live pages can change; retain dated snapshots before external distribution.

COMMERCIAL EVIDENCE

Three companies, on one basis.

Revenue, growth, funding and adoption, each held apart so unlike figures are never averaged together.

MEASURE	AVENI	DRATA	MORGANASH
History	Founded **2018**. VERIFIED	Launched 2021; fourth anniversary in 2025.	Business history from 2004; formal MARS launch 2022.
Revenue	No verified public revenue or recurring-revenue figure in this review.	**US$100M** annual recurring revenue reported February 2025.	No verified public revenue or recurring-revenue figure in this review.
Growth	Scotland Fast 50 recognition in 2026; exact company growth rate not stated.	**60%** annual revenue growth and **190%** enterprise-customer growth reported February 2026.	Named deployments; no verified revenue growth rate.
Funding	**£11M** Series A, 29 July 2024, led by Puma Private Equity. **£12M** round announced **4 June 2026**, led by PXN Ventures, with Puma Growth Partners, Lloyds Banking Group, Nationwide and Scottish Enterprise. VERIFIED	**US$200M** Series C at a **US$2B** valuation, December 2022.	Funding total and valuation not verified.
Adoption	**Over 250** banks, advice networks, wealth managers and compliance providers across the United Kingdom, on the company's own count. COMPANY CLAIM	**8,500+** global customers on the current website. COMPANY CLAIM	PayPlan and Match the Cash are named deployments. Total customers not verified.
Best use as evidence	Financial-services product and customer value.	Revenue scale and recurring evidence demand.	Consumer-understanding and support workflow.

Annual recurring revenue means repeat revenue expressed as a yearly amount. Company disclosures are attributable primary sources, not audited verification. All figures retain their original currencies and periods. [A5] [A6] [A7] [D2] [D3] [D4] [M1]

COMMERCIAL EVIDENCE

A developing market with established buyers

Our interpretation is that the market is maturing through broader product suites, integrations and ongoing monitoring. Aveni combines productivity with assurance; Drata combines controls with customer trust workflows; MorganAsh embeds assessment into servicing. These signals support an established buying need. They do not measure total market size and they do not prove demand for 4orm.

Keep the comparisons honest

Funding is not sales	Capital raised says somebody believed a story. It says nothing about customers paying.
Customer counts differ	An organisation count, a logo count and a paying-contract count are three different numbers. Aveni's 250-plus is an organisation count on its own statement.
Growth criteria are not growth rates	Aveni's award entry describes a minimum growth eligibility criterion, not the company's exact growth rate.
Percentages do not compound onto milestones	Drata's 2026 growth percentage cannot be applied mechanically to its earlier recurring-revenue milestone to manufacture a current figure.

A note on the Aveni funding date.

Aveni's 26 June 2026 article references May. Its dedicated announcement is dated **4 June 2026**. We use the dated announcement, not an assumed closing date. [A6] [A7]

02 · AVENI, THE PRIMARY MODEL

The closest model for a better interaction and less work.

5 products on one shared platform, two of them labelled beta

Aveni sells AI software for regulated financial services. Its structure separates adviser productivity from compliance oversight while using a shared foundation. This is the closest model for how 4orm could connect a better client interaction to less work for the firm.

KEY TAKEAWAYS

- Organise the product around each user's work: consumer, professional and reviewer.
- Use evidence-linked outputs, and separate what the client said from what the system inferred and what the professional approved.
- Owning a proprietary language model is not an initial requirement for 4orm.

Sources: aveni.ai product pages, read September 2026. [A1] [A2] [A3] [A4]

AVENI, THE PRIMARY MODEL

The offering, and the design lesson in each part

OFFERING	PUBLISHED FUNCTION	THE DESIGN LESSON
Assist	Meeting preparation, capture, summaries, document drafts and updates to the system of record. [A2]	Maintain a structured client brief that a professional can correct and use.
File Check	Compares the fact find, advice report and recommendation with the conversation. [A3]	Trace every important finding to its source; surface disagreement between records.
Detect	Reviews customer cases across calls, messages and documents. [A4]	Create one reviewable case across systems, with prioritised exceptions.
Approve beta	Tests customer-facing AI against policies before deployment. [A1]	Test risky scenarios and record what must be fixed before release.
Assure beta	Monitors live AI conversations and escalates risky behaviour. [A1]	Provide intervention and human escalation during the interaction.

Approve and Assure are labelled beta in current site navigation. Published capabilities do not establish independent accuracy, availability for every buyer, or Canadian suitability. [A1] [A2] [A3] [A4]

Competitive implication.

Aveni already connects client context to suitability review, and its expansion into assurance for consumer-facing AI increases the overlap. We cannot rest the pitch on nobody connecting the file, or on everyone else being reactive. Our proposed consumer-controlled exploration must deliver a measurable additional benefit. `4ORM TARGET` [A3] [A4] [A6]

AVENI, THE PRIMARY MODEL

Financial firms are already buying less administration and stronger client oversight.

Three named United Kingdom deployments, published by the vendor, each with a starting and an ending measurement.

CUSTOMER	REPORTED RESULT	MEANING FOR THE BUSINESS
Key Group United Kingdom, later-life lending and advice	**90 minutes** to **15 minutes** per quality-assurance review, using Detect. Aveni's headline is six times the efficiency of a human-only assessment. [A8]	75 minutes released per reviewed case; approximately **83%** less review time, calculated by us from the reported values.
Prosser Knowles United Kingdom, financial planning	**2 hours** to **45 minutes** of post-meeting administration. Speed to client: **4 to 6 weeks** to same day or next day. [A9]	Faster follow-up and less documentation work; the vendor describes roughly **60%** administration reduction.
Octopus Money United Kingdom, advice and coaching	**50%** less review time; **50%** less coach case-building time; **30%** initial adviser administration saving, across about **60** advisers and coaches. [A10]	Benefits reach multiple roles. These are separate measures, not additive savings.

CUSTOMER CASE All three are vendor-published customer cases. No common experimental design, comparable cost baseline or guaranteed 4orm result is established. [A8] [A9] [A10]

AVENI, THE PRIMARY MODEL

Evidence quality, and the useful detail

Key Group. Throughput, read carefully.

The case describes review prioritisation and identification of potentially vulnerable customers, with flagged cases routed to named vulnerability champions. The sixfold throughput calculation assumes other constraints remain unchanged. It does not prove sixfold firm revenue, or that staffing can fall by the same proportion.

[A8]

Prosser Knowles. The implementation lesson.

The firm piloted with a small adviser group before wider rollout and connected the work to intelliflo office, its existing back-office platform. Hollie Henson, Director of Operations, highlighted Aveni's understanding of the financial planning process. This is a practical lesson for implementation and adoption.

[A9]

Octopus Money. Coverage, stated precisely.

The current detailed table reports expansion from a **15 to 20%** call sample to **100%** automated coverage, across about 60 advisers and coaches. Human reviewers still validate flagged cases. Automated coverage does not mean every interaction received a complete human review.

[A10]

What a demonstration should show

01 **From transcript to finding**
How a transcript or document becomes a structured finding, and how a reviewer reaches the exact supporting passage.

02 **Persistence of corrections**
How corrections, overrides and unresolved concerns persist across the case.

03 **The integration contract**
Which fields in the system of record are read or written, how synchronisation failures are handled, and what the adviser must approve.

04 **The measurement basis**
How the product measures time saved after including checking, corrections and implementation effort.

Pilot lesson for 4orm.

Start with one mortgage workflow and publish a named case only after measuring its baseline, net effort, review quality and consumer experience. `4ORM TARGET`

03 · DRATA, RECURRING EVIDENCE VALUE

The strongest commercial proof that evidence is a repeat purchase.

60% annual revenue growth reported February 2026

Drata automates organisational compliance and trust reviews. Its controls are rules and safeguards that a business monitors; its evidence shows whether those controls operate. That differs from determining whether a financial product suits an individual, but the evidence workflow is directly relevant.

KEY TAKEAWAYS

- The company reported US$100M annual recurring revenue in February 2025.
- Its February 2026 update reported 60% annual revenue growth and 190% enterprise-customer growth.
- These are the strongest commercial-scale disclosures among our three models.

Sources: drata.com platform page and company releases. [D1] [D2] [D3]

DRATA, RECURRING EVIDENCE VALUE

Published capability, and what we should model

PUBLISHED CAPABILITY	WHAT 4ORM SHOULD MODEL
Automated evidence collection and continuous monitoring	Collect authorised evidence as work happens; identify missing or stale items.
Controls, risks, policies and assigned ownership	Make the next action, the responsible person and the unresolved concern visible.
Trust Center and questionnaire automation	Reuse approved information and reduce repeated requests.
Integrations and multiple compliance frameworks	Build reusable connections and mappings while preserving the meaning of each requirement.
AI agent governance, in limited availability	Study the oversight patterns. Do not treat an emerging feature as a proven operating result.

Product scope and availability from the current company website. Our design lessons are proposals. [D1]

Customer evidence, and its boundary

CUSTOMER	REPORTED RESULT	BOUNDARY
Zello Voice communications	700+ hours annually; $70K+ estimated efficiency value; sales cycles 3 to 14 days shorter. [D5]	Currency unspecified in the case; valued effort is not verified cash savings.
GitLab Software development	10 to 14 days shorter sales cycles; 50% fewer security questionnaires. [D6]	SafeBase Trust Center by Drata; a security-review workflow.
Connective Australian mortgage aggregator	SOC 2 audits: 4 to 5 months to 5 weeks. Lender audit responses: 2.5 to 3 hours to about 30 seconds. [D7]	Organisational security assurance, not individual mortgage suitability.

CUSTOMER CASE Sources are vendor-published cases. SOC 2 is an examination of a service organisation's controls. [D5] [D6] [D7]

What to adopt, and what to avoid.

Adopt recurring service value, reusable evidence, clear ownership and self-service access. **Avoid** treating every time-saving claim as a payroll reduction, or assuming enterprise security budgets translate directly into mortgage brokerage budgets.

04 · MORGANASH, CONSUMER UNDERSTANDING

Structured consumer assessment is already a purchasable product.

£500 a year, the published Standard starting price for up to 300 customers

MorganAsh combines technology with human support expertise. Its history dates to 2004; its timeline records the formal launch of the MorganAsh Resilience System, or MARS, in 2022. It is a product and service-design benchmark rather than a verified high-growth revenue comparable.

KEY TAKEAWAYS

- Consumer understanding alone is not a defensible claim of uniqueness.
- Structured assessments, changing-circumstance monitoring and supportive next steps already exist and are sold today.
- We have to show the added value of private exploration, scenario modelling and a controlled handoff.

Sources: morganash.com company and MARS product pages. [M1] [M2]

MORGANASH, CONSUMER UNDERSTANDING

What MARS does, and what to model

MARS FUNCTION	PUBLISHED APPROACH	WHAT TO MODEL IN 4ORM
Assess	Collect information from the consumer, or with assistance.	Explain why each question matters; allow clarification and correction.
Identify	Translate answers into support needs and a resilience rating.	Preserve the context behind a flag; avoid reducing the consumer to a score.
Monitor	Track changing circumstances over time.	Reassess after a relevant life or financial change.
Support	Suggest pathways and human services.	Pair a concern with a practical next step or a professional review.
Report and connect	Provide management information and system integration.	Show what was shared, what action followed and what remains open.

Published product approach from [M2]. The 4orm column is our proposed application.

Commercial model and pricing

The current MARS page lists Standard from **£500** a year and Enhanced from **£725** a year, each for up to 300 customers, excluding value added tax. Enhanced includes software integration; bespoke setup charges may apply. These are starting packages for a narrower service, not a valuation and not a like-for-like price for 4orm.

What we must acknowledge.

Structured consumer assessments, changing-circumstance monitoring and supportive next steps already exist. Consumer understanding alone is therefore not a defensible claim of uniqueness. We need to show the added value of our proposed private exploration, scenario modelling and controlled handoff to a professional.

`4ORM TARGET`

[M2] Source: morganash.com MARS product and pricing page. Status: published starting prices, not a quotation.

MORGANASH, CONSUMER UNDERSTANDING

Two named deployments

PayPlan shows the value of a fuller picture.

PayPlan is a United Kingdom debt-advice provider. Its MARS case reports that **54%** of all clients previously disclosed a vulnerability. Among clients who completed MARS assessments, **92%** were identified as vulnerable and **7%** as potentially vulnerable. These populations differ. The figures are not a controlled before-and-after improvement and not a national prevalence estimate. Emma Gibbons, PayPlan's vulnerability lead, said that using MARS helps clients feel more comfortable sharing personal information. That is an attributed customer observation, not proof that AI counselling increases disclosure or comprehension.

[M3]

Match the Cash shows a commercial application.

Match the Cash is a United Kingdom lender operating Guarantor My Loan and Share My Loan. Its published case describes adding MARS to onboarding, then embedding it through a software integration. The firm reports that additional consumer context supported approvals for some previously borderline applicants and helped it develop a new loan product, with no effect on onboarding speed. The case does not quantify the approval lift, sales revenue, default performance or sample size.

[M4]

Lesson for 4orm.

Test whether a private, optional interaction surfaces useful context the professional did not already have. Measure whether it changes the support or the recommendation, rather than celebrating the volume of sensitive data collected. `4ORM TARGET`

[D]

What to inspect

01 **Question purpose**
Which questions change the support offered, and which collect information without a clear purpose.

02 **The right to decline**
How a consumer can decline, correct or explain an answer without being unfairly categorised.

03 **Temporary against continuing**
How the system distinguishes temporary circumstances from continuing needs, and routes urgent concerns to a human.

04 **The access boundary**
How the business sees useful support information without gaining access to private exploration.

MORGANASH, CONSUMER UNDERSTANDING

What the design implies, and what we would have to collect

DESIGN IMPLICATION	EVIDENCE 4ORM SHOULD COLLECT
Help the consumer progress toward an appropriate solution	Document what changed in the professional's action, and why it benefited the client.
Keep the interaction proportionate	Completion, abandonment, assistance requests and total time, compared with the current journey.
Offer useful next steps	Track whether support was offered, accepted and followed through.
Retain meaningful control	Check that the consumer understands what is private, what is shared and who can access it.

What copying MorganAsh would actually cost us

Question design	The work is not the software. It is deciding which questions change the support offered, and retiring the ones that only collect data.
Human services behind it	MorganAsh pairs the assessment with human support expertise. A product that surfaces a concern and offers nowhere to send it is worse than one that never asked.
Reassessment discipline	Monitoring changing circumstances means a recontact rule, an escalation path and a threshold for what counts as a relevant change.
Proportionality	Every question added is friction the consumer pays for. Completion and abandonment have to be measured alongside the richness of what was collected.

Why this matters commercially.

Consumer understanding can support commercial progress and service quality at the same time. Our claim should be that 4orm is designed to achieve both, with the outcomes established in pilots rather than asserted here. `4ORM TARGET`

05 · WHERE 4ORM PROPOSES TO DIFFER

Six proposed differences, each one still a hypothesis.

6 capabilities, every one with something already established nearby

4orm Finance is building counselling-centred AI to help people privately explore major financial decisions, model possible outcomes and understand risks. People choose what to share with the business serving them. The proposed business value is better client understanding, less repeated discovery and a usable decision record.

KEY TAKEAWAYS

- Every proposed capability has something established nearby. None of them is empty ground.
- The proposed differences are hypotheses, not claims that competitors lack these capabilities.
- The strongest case for 4orm will be a customer result showing why the connection matters.

Capability comparisons: [A1] to [A4], [D1], [M2], [C1] to [C4].

WHERE 4ORM PROPOSES TO DIFFER

Each proposal, against what already exists.

PROPOSED 4ORM CAPABILITY	WHAT IS ALREADY ESTABLISHED NEARBY	WHAT 4ORM MUST DEMONSTRATE
Private exploration controlled by the consumer	MorganAsh obtains consumer assessments; Aveni supports adviser and consumer-AI workflows.	That a private workspace and selective sharing materially improve usefulness and trust.
Goals and financial scenarios	Structured client facts and suitability review already exist.	That scenario assumptions are understandable, calculations are correct and outcomes inform the conversation.
Preventive risk assessment	All three models identify risks or needs; prevention is not an exclusive category.	That the questions reveal relevant concerns early and lead to proportionate safeguards.
Shared professional decision record	Aveni reviews cases; Drata automates evidence; Recordsure supports suitability evidence.	That the combined record reduces reconstruction and rework beyond the firm's existing tools.
Canadian mortgage delivery	Finmo, Filogix and Newton Velocity already serve the first target workflow.	That a buyer adopts and pays for an additional or embedded capability with a low implementation burden.
Reassessment as life changes	MorganAsh already monitors circumstances over time.	That consumers return, and firms act on important changes without excessive notifications.

4ORM TARGET Proposed differences are hypotheses, not claims that competitors lack these capabilities. [A3] [M2] [C1] [C2] [C3] [C4]

A specific proposition to test.

We want to connect a consumer's own exploration and understanding to the professional's decision process, with permission, then keep the reasoning and evidence usable over time. The strongest case for 4orm will be a customer result showing why that connection matters.

The preventive-safety analogy is a design inspiration supplied by 4orm. This review does not validate transferring an industrial safety method into financial advice, or establish counselling effectiveness.

06 · THE DELIVERY BRIEF AND THE COMMERCIAL CASE

Scope one mortgage journey, then publish what it measured.

1 workflow, one design partner, one measured result

Use the incumbents to inform the design, then scope one mortgage journey with a design partner. What follows is a proposed brief, not an agreed delivery schedule and not a claim that the capabilities already ship.

KEY TAKEAWAYS

- Keep source statements, calculations, interpretations and professional conclusions separately identifiable.
- Agree which decisions the software may explain, which need professional judgement and which trigger escalation.
- Stop expansion if net effort does not improve over the existing process.

Status: proposed brief and management direction, September 2026.

THE DELIVERY BRIEF

What to study and build first

WORK PACKAGE	MODEL TO INSPECT	REVIEWABLE OUTPUT
Consumer discovery	MorganAsh question flow; Aveni structured fact gathering	Question map linking each prompt to purpose, follow-up, support or decision relevance.
Private and shared records	4orm privacy requirements; incumbent access patterns	Two clear data boundaries, a share preview, a consent receipt and a tested access model.
Scenario modelling	4orm decision-support requirements	Deterministic calculations, visible assumptions, scenario comparisons and reviewed explanations.
Professional review	Aveni Assist and File Check	Brief with source references, missing information, unresolved concerns and editable findings.
Evidence and integration	Drata ownership and evidence reuse; Aveni workflows into the system of record	One agreed connector or structured export, stable identifiers, change history and error handling.
Monitoring and support	MorganAsh reassessment; Aveni assurance	Rules for recontact, human escalation and review of changed facts.

Decisions required before implementation

01 **The explanation boundary**

Agree which decisions the software may explain, which need professional judgement and which trigger escalation.

02 **Separable layers**

Keep source statements, calculations, interpretations and professional conclusions separately identifiable.

03 **Withdrawal**

Define what withdrawal of future sharing does, and how already-shared firm records are handled under the agreed retention policy.

04 **Isolation and access**

Define tenant isolation, role-based access, logging, correction history and authorised exports; verify them in the pilot environment.

THE DELIVERY BRIEF

Pilot measures and stopping conditions

MEASURE	WHAT WOULD CHANGE OUR DECISION
Net staff time including review and corrections	Stop expansion if net effort does not improve over the existing process.
Consumer completion and understanding	Redesign if the journey adds friction, or produces confidence without comprehension.
Evidence quality and permission accuracy	Do not release with unresolved material errors or unauthorised sharing.
Willingness to pay and delivery cost	Reprice or narrow the scope if paid value cannot cover ongoing delivery and support.

A transparent illustration

Assume a **C$30,000** annual subscription, **1,200** cases a year and **C$80** per staff hour. Covering the subscription alone requires 375 hours a year, equivalent to **18.75 minutes** per case. This is arithmetic using illustrative assumptions, not proposed contracted pricing and not a savings forecast.

4ORM TARGET

The actual threshold is higher after implementation, training, integration and incremental support costs. Economic capacity only becomes cash savings when the firm changes its spending. Count conversion or loss benefits separately, and only when measured.

How we should earn the contract.

A firm-sponsored mortgage pilot with a defined workflow, included consumer access, an agreed implementation scope and measured outcomes. A recurring fee should buy ongoing access, reliable records, support and updates. Any usage charge should correspond to a clear unit of customer value. Pricing remains to be validated with buyers.

THE COMMERCIAL CASE

The category has been commercialised. 4orm's fit has not.

Drata demonstrates substantial recurring revenue; Aveni demonstrates investment and adoption in financial-services AI; MorganAsh demonstrates a purchasable consumer-assessment workflow.

Together they reduce uncertainty about whether these jobs matter. They do not establish 4orm's product-market fit. [D2] [A6] [M2]

Value the firm may gain, and how to count it

VALUE THE FIRM MAY GAIN	HOW TO MEASURE IT WITHOUT DOUBLE COUNTING
Released staff capacity	Net minutes saved after review and corrections, multiplied by actual loaded labour cost.
Less external spend or avoidable hiring	Verified invoice reduction, or a documented hire no longer required; separate from reused capacity.
Faster movement through the process	Time to complete discovery, follow-up and review; distinguish faster cash timing from new revenue.
Better decisions and fewer repeated concerns	Record changes to recommendations, support actions, complaints and rework over a defined period.

How this is said out loud.

"Businesses already buy software that reduces administration, strengthens client review and keeps evidence ready. We are learning from Aveni's financial workflows, Drata's recurring evidence model and MorganAsh's consumer assessments. 4orm is building a consumer-controlled approach that connects private exploration to the professional's workflow. Our next proof is a paid mortgage deployment showing better understanding and less work."

Review scope: selected primary product pages, company disclosures and vendor-published customer cases. No paid demonstrations, source-code inspection, private financial statements or independent customer interviews were conducted. Exact company revenue, margins and retention remain unknown unless expressly stated.

C3	DLC acquisition of Filogix	4 August 2026. Acquirer-issued release. C$58.5M; 8,000+ brokers; about 350 lenders; about C$60B funded volume to 31 May 2026.
C4	Recordsure product offering	Current financial-services suitability, conversation and evidence offering. Ongoing competitor to monitor.

SOURCE REGISTER

Evidence and terminology

Customer cases	They describe particular deployments. They are not national surveys and not independent causal studies.
Annual recurring revenue	A recurring-revenue run rate, not profit.
Not verified	The reviewed sources did not establish the metric. It does not mean the value is zero.
Terms used	AI means artificial intelligence. API means a software interface between systems. SOC 2 is an examination of a service organisation's controls.

What was not done in this review

No paid demonstrations	Nothing here comes from using any of the three products. Every capability is a published claim.
No source-code inspection	No judgement is offered about how any of these products works internally.
No private financials	Revenue, margin and retention are unknown except where a company published them itself.
No independent customer interviews	Every customer result in this paper was published by the vendor, not gathered from the customer by us.

Standing and scope.

4orm positioning, proposed requirements and pilot recommendations reflect management direction and analysis. None of the named companies is presented as a 4orm partner or endorser. The selected three are models to learn from, not an exhaustive competitor list: the Competitive landscape names the full field, including the Canadian mortgage software our first customers already use.

4orming trust into financial decisions.

People · Trust · Clear Outcomes
