

One card, four market numbers, one denominator

The market is counted entity by entity from published registries, priced tier by tier on one card, and every share is stated against a named population rather than blended. This document is the arithmetic. The argument for the price sits in the price evidence document.

18,254	\$840M	745	28.7%
ENTITIES ON THE ADDRESSABLE REGISTER	CANADA RECURRING MARKET, THE HEADLINE	FUND HOLDING PROVIDERS, THE DENOMINATOR	SHARE OF THAT POPULATION HELD AT 2031

1 The card, and what a firm locks

Tier	The card, held flat	Signing in 2027	Signing from 2028	Locked, US dollars	Entities
Command and institution	\$687,000	\$766,005	\$858,750	US\$618,919	65
Enterprise and complex	\$219,500	\$244,743	\$274,375	US\$197,748	552
Mid market regulated	\$83,250	\$92,824	\$104,063	US\$75,000	3,091
Small regulated firm	\$29,450	\$32,837	\$36,813	US\$26,532	13,746
Partner and white label	\$130,000	\$144,950	\$162,500	US\$117,117	800

Legend. One price per tier, held flat for the life of the model. The card steps once, on **1 January 2028**, and a firm keeps the price it signed at for as long as it stays, so the 2027 column is a closing price rather than a discount. Converted at the Bank of Canada daily rate of 14 August 2026, 1.3875 for the United States dollar.

Every comparison is made on the locked price, never on the card.

Our card set against a competitor's signed contract flatters us by twenty five per cent. The locked price is what a customer actually pays and what the model collects, so it is the only figure the market documents compare.

The register, counted once

Every firm appears exactly once and sits in one tier only. The tiers are mutually exclusive, so nothing is double counted between them.

Bars start at zero and run to 13,746. The register totals **18,254** entities: payment providers, law firms, mortgage administrators and brokerages, insolvency trustees, property managers, insurance brokerages, real estate brokerages, collection agencies and travel registrants.

2

How much of the count is a published register, and how much is judgement

Tier	Entities	Share of register	Evidence behind it
Command and institution	65	0.4%	0 of 3 rows primary
Enterprise and complex	552	3.0%	4 of 7 rows primary
Mid market regulated	3,091	16.9%	5 of 8 rows primary
Small regulated firm	13,746	75.3%	4 of 8 rows primary
Partner and white label	800	4.4%	0 of 5 rows primary

Legend. Primary means the count is read off a published register. A management assumption is a judgement, and it is marked as one. The two tiers with no primary row are the smallest and the widest: six institutions at the top, and the partner channel, where no roster is published anywhere.

Two populations are held out of the register on purpose.

578 consumer driven banking participants, being the small business share of the firms a government impact statement expects in year one, and **459** payment providers waiting for registration, who cannot operate and hold no customer funds yet. Neither carries revenue anywhere in the plan. They are recorded so the omission is deliberate rather than an oversight.

Four ways to size the same market

Each layer is smaller than the one above it, and the top layer is never used as the bottom of a capture rate.

Bars start at zero and run to \$1.77B. The figure the plan works to is the second, **\$840,471,950**, which is **\$46,043** of recurring revenue for each entity on the register. The ceiling is the whole repeating market at list price multiplied by 1.9 as a judgement about premium add-ons, and it is a ceiling only.

3 How the headline is built, tier by tier

Tier	Entities	The card	Recurring at list	Budget qualified	Qualified market
Command and institution	65	\$687,000	\$44,655,000	100%	\$44,655,000
Enterprise and complex	552	\$219,500	\$121,164,000	95%	\$115,105,800
Mid market regulated	3,091	\$83,250	\$257,325,750	70%	\$180,128,025
Small regulated firm	13,746	\$29,450	\$404,819,700	35%	\$141,686,895
Partner and white label	800	\$130,000	\$104,000,000	60%	\$62,400,000
Gross recurring, before overlap	18,254		\$931,964,450		\$543,975,720

Legend. Budget qualified is the share of a tier with money already set aside for compliance or finance operations. It is a management assumption, made band by band, and it is the only judgement in this table.

\$91,492,500 is deducted so a firm served through a partner is counted once.

2,400 small firms and 250 mid market firms are administered through the 800 partners, three client firms each. Counting the partner minimum and that firm's own subscription would count one relationship twice, so the smaller of the two comes out.

The denominator, and the share the plan claims

Being registered is not what triggers the law. Holding customer money is. That is why the denominator is 745 rather than 1,562.

Measure	Figure	What it is
Registered payment service providers	1,562	The whole Bank of Canada register
Of those, holding customer funds	745	The population the duty attaches to, and the denominator
In the application queue	459	Held out until they are registered, and shown separately
Held at the outside review date	60	Where the plan stands three years after the duty began, 8.1 per cent
Held at 2031, on this plan	214	Of the 745
Every entity on the register	18,254	Every industry the product reaches
Share across every industry, 2031	4.7%	865 customers and partners against 18,254. Shown because a reader works it out, never as the headline

Legend. Share is customers held at 31 December divided by the population of that segment. The 745 is split across four size bands so no firm is counted twice.

4 The ramp, stated in firms rather than as a penetration rate

Year	Firms held	Share of 745	What the year is
2026	0	0.0%	
2027	13	1.7%	
2028	60	8.1%	
2029	110	14.8%	
2030	162	21.7%	
2031	214	28.7%	

Legend. Stated in firms because a penetration rate hides the number of signatures the plan actually needs. An earlier claim of 224 firms inside the first three years is withdrawn: it is six signatures a month for twenty five consecutive months from a standing start, and it is not deliverable at any funded headcount.

2026 is design partners only, with no paid payment provider signed. 2028 is the year the first outside reviews fall due, 2029 is the year the review wave converts, and 2031 is the headline year at **28.7 per cent** of the fund holding population.

What comparable companies actually reached

Each one measured against its own named population, never against a blended market.

Bars start at zero and run to 31 per cent. A target of **28.7 per cent** by 2031 sits above the early curve and below the best outcome observed, which is where a plan should sit if it is going to be believed.

5 The card never moves. The mix of cohorts sitting on it does

	2027	2028	2029	2030	2031
The card, every tier, both scenarios	1.00	1.00	1.00	1.00	1.00
Blended step actually realised	1.00	1.00	1.00	1.00	1.00

Legend. The list price never moves and the scenario selector cannot touch it. What moves is the mix of customers sitting on it: the 2027 cohort locked at 1.115 times the card and every cohort from 2028 at 1.25, so the blended step rises as the later cohorts come to outnumber the first one.

Nobody is ever repriced.

A firm signing in 2027 pays that price every year it remains a customer. The firm next door that waits until 2028 pays the higher one, every year, for the same product. That is why the 2027 column of the card is a closing price and why the blended step in the table above never reaches 1.25.
