

How Big Is This

Three numbers describe the size of a market. This document gives all three, says in plain words what each one is, shows every deduction between them, and marks the one number that is a claim about this company rather than a count of somebody else's firms. If the three terms are new, the next page explains them before any of this needs to be understood.

\$840,471,950	\$490,572,719	\$105,276,946	12.5%
TOTAL MARKET, EVERYONE WHO OWES IT	OF THAT, THE SHARE WITH A BUDGET TODAY	WHAT THE PLAN TAKES BY 2031	OF THE TOTAL, IN FIVE YEARS

1 The whole document on one page

Each band is drawn to the width of its own figure, so the shape narrows the way the argument does. The top band is the ceiling: every entity buying every module at the highest price. It is the palest shade because it is a boundary rather than a market, and it is the gross figure multiplied by 1.9, the assumed uplift if every firm bought every part of the product rather than the part built for its size. The beachhead is the term for the first population a company sells into: here it is the 745 payment providers, priced each in its own size band, and it sits inside the market above it rather than beside it. The card, used throughout, means the rate card: the one published list price for each size of firm.

2 Start here, if you have not met these three words

Market sizing has three standard terms and a great deal of jargon around them. They are simple ideas. Imagine you sell winter tires.

The term	What it means	The winter tire version
Total addressable market, or TAM	Everybody who has the underlying need, whether or not they will ever buy from anyone. The outer boundary.	Every car in Canada.
Serviceable available market, or SAM	The part of that you could actually sell to: the right region, the right rules, and a buyer with money set aside.	Every car in the provinces where winter tires are required by law, whose owner has already put money aside for a set.
Serviceable obtainable market, or SOM	What you win in a stated period, against real competitors, with the sales team you will actually have.	How many sets you fit in your own bays over the next five years.

Legend. TAM is a boundary, not a forecast. SAM is a filter applied to it. SOM is the only one of the three that is a claim about this company, and it is the only one that should be argued about.

3 Each one sits inside the one above it

Drawn to area rather than to width, because that is how a reader reads nested shapes. The point of the picture is the thing most often got wrong about market sizing: these are not three markets to be added together. They are one market, filtered twice.

The mistake this document is built to avoid

Quoting the outer boundary as though it were a business. A large total is easy to produce and proves nothing: every failed vendor in the precedent evidence had one. The number that carries weight is the smallest, because it is the only one somebody can be held to.

How to read any market size, including this one

Ask three questions. Can the buyers be named and counted, or are they estimated. Do they owe a duty they cannot opt out of. And what share does the plan claim in a stated year. This document answers all three, and the section headed the assumption to attack first names the weakest of them.

4 How the biggest number becomes the smallest

Every deduction between the ceiling and the plan, in order. Navy is where the count starts, grey is what comes out, blue is what is left. The first two deductions are arithmetic on a population and are not in dispute. The third is judgement and is set out under SAM below. The fourth is the business plan, and it is the only bar here anybody should argue with. The bars are labelled to the tenth of a million, so adding the printed figures lands \$100,000 short of the end bar rather than exactly on it. The underlying chain is exact.

5 What each deduction actually removes

Priced to size rather than to the top card, \$838,768,005	The ceiling assumes every firm buys the full premium stack. The market assumes each firm buys the product built for its size, at the one list price for that band. Same population, priced against what a firm of that size would buy.
Firms counted twice, \$91,492,500	2,400 small firms and 250 mid market firms would reach the product through a partner such as an accounting firm or an association, not directly. Counting them in both places would inflate the total, so they come out once.
No budget set aside today, \$349,899,231	Owing a duty is not the same as having money for it. Each band carries a budget factor, and the smaller the firm the lower it is. The section headed SAM sets out every factor.
What the plan does not win, \$385,295,773	Four fifths of the firms that have a budget will buy from somebody else, build it themselves, or keep doing it by hand. That is the normal outcome for any vendor and it is stated rather than assumed away.

Read the chart from the right

Most market sizing is read left to right, and the eye anchors on the first and biggest bar. Read this one from the right instead. The blue bar is what the company is claiming. Every grey bar to its left is a reason the claim is smaller than the headline, and each one is either arithmetic anybody can check or a judgement stated on its own page. A market size that cannot be read this way is asking to be taken on trust.

6 The same journey, counted in firms rather than dollars

Read against the same layer, the plan takes 21.5 per cent of the serviceable market by value and 12.3 per cent of the qualified firms by count. Those two do not match, and the gap is the honest finding: the average plan customer pays \$121,707 a year against \$69,793 for the average qualified firm, so the plan wins proportionally more of the larger bands. That is a real dependency and it is stated rather than smoothed over. The count funnel is the one to carry into a sales conversation, because a salesperson works a list of firms rather than a quantity of dollars.

7 How firmly the population is counted

Why the split is published rather than smoothed over

Sixty per cent counted and forty per cent estimated is an ordinary result for a market that spans a dozen regulators, and it is a better result than most market sizing discloses at all. Stating it does two things. A reader who wants to discount the estimated part can do so segment by segment, and a reader who finds the disclosed weakness stops looking for a hidden one. The one population that matters most, the 745 payment providers the product is sold to first, sits entirely inside the counted sixty per cent.

8 TAM, and where the count comes from

Total addressable market here means every regulated Canadian entity that holds money belonging to somebody else and therefore owes a recurring duty to prove the money is where it should be. There are 18,254. Each appears exactly once, in one size band only.

Size band	Entities	List price each	At list price	What sits in this band
Command and institution	65	\$687,000	\$44,655,000	Banks, processors, major platforms and reserve intermediaries
Enterprise and complex	552	\$219,500	\$121,164,000	Multi entity groups, integrations and high value evidence
Mid market regulated	3,091	\$83,250	\$257,325,750	An established firm with a compliance function of its own
Small regulated firm	13,746	\$29,450	\$404,819,700	Payment providers, small trust firms and simpler workflows
Partner and white label	800	\$130,000	\$104,000,000	Reviewers, accountants, networks and associations, who put the product in front of their own clients under their own name
Gross, before removing double counting	18,254		\$931,964,450	Less \$91,492,500 of overlap gives \$840,471,950

Legend. At list price: entities multiplied by the one list price for that band. All figures are Canadian dollars.

9 Where the firms are, against where the money is

Both sides are struck on the gross figure of \$931,964,450, before the overlap deduction. Three quarters of the firms sit in the smallest band and carry 43 per cent of the value. The 65 firms in the highest priced band carry 5 per cent. That shape decides how the product is sold: a volume business with a handful of large accounts on top, rather than an enterprise business with a long tail. It is also why the budget factor on the small band is the most important judgement in this document.

10 SAM, and the filter that produces it

Serviceable available market is the total with one filter applied: does this firm have money set aside for this today. A duty creates an obligation. It does not, on its own, create a budget line.

Bar length is the band at list price. The filled part is the share judged to have a budget today. The pale remainder is a firm that owes the duty and has nobody whose job it is, which is a different sale rather than no sale: it creates a budget rather than competing for one.

Size band	At list price	Factor	Serviceable	Why the factor is what it is
Command and institution	\$44,655,000	100%	\$44,655,000	A bank or major processor already runs a compliance budget with a named owner. The question is which vendor, not whether to spend
Enterprise and complex	\$121,164,000	95%	\$115,105,800	Multi entity groups almost always carry a compliance function. The five per cent covers firms whose spend is committed elsewhere for the year
Mid market regulated	\$257,325,750	70%	\$180,128,025	An established firm usually has a compliance officer and a software line. Three in ten do the work inside an existing role with no separate budget
Small regulated firm	\$404,819,700	35%	\$141,686,895	The hardest and most important number here. Two thirds owe the duty and have nobody whose job it is, so the sale creates a budget rather than competing for one
Partner and white label	\$104,000,000	60%	\$62,400,000	A reviewer or accounting firm buys tooling once it has enough clients to justify it. Around six in ten are judged to be at that scale
Gross qualified	\$931,964,450	58%	\$543,975,720	Less the overlap scaled in the same proportion gives \$490,572,719

Legend. Factor: the share of firms in the band judged to have money set aside for this today. These are judgement, not measurement, and no customer has yet confirmed one.

11 The assumption to attack first, before reading any of what follows

The 35 per cent budget factor on the small band governs \$263,132,805 of the gap between the total and the serviceable market, which is more than the other four bands combined. At 20 per cent the serviceable market falls to \$435,810,569. At 50 per cent it rises to \$545,334,440. Twenty discovery conversations with small registered firms would move that from judgement to evidence, and nothing else in this document would move as much.

12 SOM, the only number that is a claim about this company

Serviceable obtainable market is what the plan takes, in a stated year, against real competitors, with the team the plan actually funds. It is \$105,276,946 of revenue in 2031, from 865 customers, of which 31 are partners.

REVENUE BY YEAR, FROM THE MASTER PRO FORMA

Measure	Figure	What it means
Revenue in 2031	\$105,276,946	What the plan bills in that calendar year
Recurring revenue at the end of 2031	\$108,935,933	The annualised value of what is under contract on 31 December
Customers at the end of 2031	865	End customers and partners, each counted once. 31 of the 865 are partners
Share of the serviceable market, by value	21.5%	Of every dollar spent by firms judged to have a budget, the plan takes about one in five. By firm count rather than by value the same share is 12.3 per cent
Share of the total market, by value	12.5%	Of every dollar owed across the whole register, the plan takes about one in eight. By firm count the same share is 4.7 per cent
Share of the first population	28.7%	214 of the 745 payment providers that hold funds

Legend. All figures from the master pro forma, the single financial model every number in the company traces to, in its version of 17 August 2026. Revenue is billed across the year; recurring revenue is measured at a point in time, which is why the two differ.

13 The same plan, counted in customers

CUSTOMERS HELD AT EACH YEAR END, END CUSTOMERS AND PARTNERS

Revenue grows faster than the customer count, and the gap is the pricing argument. A customer signing in 2027 keeps the price it signed at for as long as it stays, while each group arriving in a later year signs at a higher one. Average revenue per customer rises from \$56,231 in 2027 to \$121,707 in 2031 without anybody being repriced. Both figures are revenue billed in the year divided by customers held at the end of it, which is the basis to use when comparing against the market figures on the previous page.

14 The beachhead, and why it is the number to watch

Every early customer comes from the first box, because it is the only population in this document that is a published government list rather than a count assembled from several sources. A sales list that can be opened and counted beats a larger market that has to be estimated, and the capture precedent paper, 02.3, puts that difference at roughly twenty times in the share a vendor ends up holding. The engine, named in the fourth box, means the software itself: it takes in the data, applies a versioned rule, produces the record and proves afterwards what was done.

15 Where 28.7 per cent sits against what has actually happened

Share of the named population each vendor reached. Blue is the plan, mid navy a vendor selling into a regulator published list, and the rust bars vendors selling into an analyst estimate. The plan sits above the two published list outcomes below it and below the one above it. Full dossiers and the filing behind every ratio are in the capture precedent paper, 02.3.

16 Where the market goes after the beachhead

Law firms holding client money		5,687	federal business counts
Property management brokerages		3,500	estimated, no national roster
Mortgage brokerages and administrators		3,208	register counted in Ontario
Real estate brokerages		1,392	federal business counts
Insurance brokerages		1,200	estimated
Travel registrants		900	Ontario regulation, scaled
Payment providers holding funds		745	the beachhead, fully counted
Collection agencies		400	Ontario regulation, scaled
Insolvency trustee firms		360	estimated

The nine largest segments in the register that owe a duty over money held for somebody else, by count. They carry 17,392 of the 18,254 entities, and twenty two smaller segments hold the remaining 862. Law firms appear twice in the register and in two different roles: 5,687 of them hold client money in trust and would buy the product, and 80 of them administer evidence for other firms and sit in the partner band. The two are counted separately and are not the same firms. Blue is where the plan starts. Mid navy is a population counted from a register or a statutory filing; pale is a management estimate. The engine that proves a daily position for a payment provider proves a trust account for a law firm or a brokerage without being rebuilt, which is why the beachhead is the smallest bar and not the largest.

Why the smallest population is the right one to start in

It is fully counted, it is published by a regulator, every firm on it carries a flag saying it holds other people's money, and the duty is already in force. No other segment here has all four. A larger population that has to be estimated is a worse place to start than a smaller one that can be opened and read.

What carries across, and what does not

The engine carries across: take in the data, apply a versioned rule, produce the record, prove afterwards what was done. The regulatory content does not. Each new segment needs its own rules encoded and its own reviewer relationship, which is the work, and it is why these are sequential rather than simultaneous.

What this page is not

It is not a plan and none of it is in the model. Every dollar in this document comes from the payment provider population and the segments already priced in the register. These counts are shown so a reader can see the shape of what sits beyond the first market, and so that nobody has to take on trust the claim that the engine generalises. A segment enters the plan when somebody in it has said the duty hurts, and not before.

17 What this document supersedes

This number was blocked until today, because two earlier papers disagreed with each other and with the model. Both are withdrawn. The master pro forma is canonical by standing rule.

What it said	Where it came from	Status
\$218,582,312 total, \$143,857,527 serviceable and \$10,921,933 obtainable in 2031, across 19,527 firms	Market size paper of 15 August 2026	Withdrawn
\$690,000,000 across 19,113 entities	Precedent evidence paper and the data room guide	Withdrawn
\$840,471,950 total, \$490,572,719 serviceable and \$105,276,946 obtainable in 2031, across 18,254 entities	Master pro forma of 17 August 2026	Canonical

Legend. Withdrawn means the figure is not to be used, quoted or restated anywhere. The entity counts differ because the register was rebuilt to remove segments owing no trust duty and to stop counting firms twice where they reach the product through a partner.

18 What could be wrong, and what it would cost

Forty per cent of the population is estimated

Eighteen of thirty one segments carry 7,325 entities counted from nearby figures rather than a register. Property management and insurance brokerages are the largest and neither publishes a national roster. Each is named in the model so a reader can discount it rather than having to find it.

One list price per band is a simplification

A real rate card discounts, bundles and negotiates. Holding one price per band keeps the arithmetic checkable and means the total is neither inflated by premium modules nor deflated by discounting. The two are assumed to cancel, which is a convenience rather than a finding.

A market number does not need to be right to the dollar. It needs to be right about order of magnitude and about who is in it. \$840,471,950 across 18,254 firms is \$46,043 each per year, which is one mid sized software subscription rather than a transformation programme. Sources: entity counts, prices and every derived figure come from the master pro forma of 17 August 2026, on the Population Register and TAM by Layer tabs, where each segment carries its own basis. The 745 payment providers are counted from the [Bank of Canada register](#), and the duty is in [SOR/2023-229](#), section 15.
