

Somebody is holding **your money** right now

A deposit on a house. A rent payment on its way to a landlord. The balance sitting with a payment company between the moment you were paid and the moment you can spend it. A retainer with a lawyer. A deposit on a car. In every one of those cases a business is holding money that belongs to somebody else, and in almost every one of them nobody can prove, on any given day, exactly whose money it is or that it is all still there. 4orm Finance builds the proof.

\$704M	5 to 10%	\$1.6B	2,500	\$1.19T
REPORTED LOST TO FRAUD IN CANADA, 2025	THE SHARE OF FRAUD ACTUALLY REPORTED	SITTING UNCLAIMED AT THE BANK OF CANADA	CANADIAN FIRMS NOW CARRYING THE DUTY	MOVING THROUGH CANADIAN PAYMENTS

1 Start here

Since 8 September 2025, a Canadian business that holds money belonging to its customers has had to write down every day how much it is holding and who it belongs to, keep that record, and produce it when an outside examiner asks. That is safeguarding, and it is the whole duty. It sounds administrative. It is not. It is the difference between a customer getting their money back when a business fails and a customer joining a queue.

What this document is	The case for the company, starting with the people it protects rather than with the market it sells into. The first half is what is wrong today and who pays for it. The second half is what the numbers say, what the modelling found, and what the benchmarks bear.
What the product is	Software that performs, keeps and produces the daily proof a regulated business owes when it holds somebody else's money. It reads what the bank actually holds, reads what the business owes each customer, compares them every day, records the answer, and seals it so it can be shown later to have gone unchanged.
Why nobody has built it	Doing it means reaching two places at once: the bank account, and the ledger, which is the daily list of who is owed what. Twenty three products were priced against this market. Four reach both, and all four were built for the British rules. None carries the Canadian one.

2 Who is affected

Not a market segment. Anyone who has ever handed money to a business and waited. The duty reaches roughly 2,500 Canadian firms, and behind each of those firms sits everybody whose money they hold.

The person buying a house	A deposit goes to a brokerage the day an offer is accepted and sits in a trust account until closing. The buyer has a receipt. Nobody outside the brokerage can confirm on any given day that the money is still there.
The person selling a house	Proceeds pass through the same account. A delayed closing in Ontario carries a legislated cost of \$150 a day, capped at \$7,500, which is what the law thinks a day of waiting is worth.
The person buying a car	A deposit is held by a dealership. Ontario has no automatic cooling off period, the regulator cannot compel a dealer to return a deposit, and only a court can. The consumer's whole case is the record of what was agreed and what was held.
The person waiting on a loan	Funds are approved, then wait. Nothing in the chain proves where the money is between approval and arrival.
The person with a lawyer	A retainer goes into a trust account whose balance must be matched against the books every month, and in Ontario that check may be produced twenty five days after the month ends.
The person paid through a platform	Wages, marketplace earnings or a refund sit with a payment company. If that company fails while holding the balance, what the customer gets back depends entirely on whether anybody wrote down whose money it was.
The business itself	None of the firms above set out to lose anybody's money. They are carrying a duty that arrived in September 2025, with a monthly spreadsheet and somebody's evening.

The common thread is not theft. It is that nobody can prove the position on the day it matters

Every case above has a business acting in good faith, a customer with a receipt, and no independent record of the daily position. When something goes wrong, the argument is about what was held rather than about what is owed, and the person who cannot prove it is the person who was never holding the records.

3

The money that goes missing

Canadians reported more than \$704 million lost to fraud in 2025 across more than 112,000 reports, the highest on record. The Government of Canada puts the share of fraud actually reported at five to ten per cent. If that is right, the money actually taken from Canadians last year was somewhere between \$7 billion and \$14 billion.

Where the money went, 2025	Reports	Victims	Reported loss
Investment fraud	4,409	3,867	\$351.0M
Spear phishing and payment redirection	813	571	\$67.9M
Relationship and romance	1,093	933	\$63.3M
Job fraud	2,148	1,726	\$50.6M
Service fraud	3,393	2,444	\$19.5M
Identity fraud	8,403	8,403	no loss published
ALL REPORTED FRAUD, 2025	112,000+		\$704M+

Legend. Canadian Anti-Fraud Centre, top frauds of 2025. These six categories are the largest, not the whole, which is why they sum to less than the total. Identity fraud carries no dollar figure because, in the Centre's own words, most victims of identity fraud are not responsible for the losses. Reported loss in 2024 was \$638 million across 108,878 reports and more than 34,000 victims. Every figure on this page is published by the body named beside it and was read on 17 August 2026. Canadian dollars unless stated.

Half of everything Canadians lost to fraud last year was money somebody else was holding

Investment fraud alone took \$351 million of the \$704 million reported. It grew from \$315.4 million the year before. Separately, Canadians reported \$154 million lost through wire transfers and \$36.7 million through Interac e-Transfers in 2024, and the Government of Canada, applying its own assumption that reports represent 7.5 per cent of the truth, published scaled figures of \$2.1 billion and \$489 million for those two rails.

4 The money that gets held up

Money that is not stolen still stops moving. It sits in trust accounts that are proved once a month and signed weeks later, and some of it never finds its owner at all.

Who holds it	How often the position is proved	How late the proof may be
Alberta real estate brokerage	Monthly bank reconciliation, signed by the broker	30 days after the prior month's statement
Ontario real estate brokerage	Monthly trust reconciliation	30 days after month end
British Columbia real estate brokerage	Monthly bank and trust asset and liability reconciliation	5 weeks after month end
Ontario law firm	Monthly comparison of trust balances to unexpended balances	25 days after month end
British Columbia law firm	Three way monthly reconciliation	30 days after the date
Alberta law firm	Three way monthly reconciliation	before the end of the next month
40rm Finance	Every day, sealed	Same day

Legend. Taken from the Real Estate Council of Alberta, the Real Estate Council of Ontario, the British Columbia Financial Services Authority, Law Society of Ontario By-Law 9, the Law Society of British Columbia Trust Accounting Handbook and the Law Society of Alberta. Every figure on this page is published by the body named beside it and was read on 17 August 2026. Canadian dollars unless stated.

1 What a monthly cycle allows

- Up to sixty days can pass between an event and its confirmation.
- At four Ontario brokerages, roughly \$2.7 million was taken from trust accounts and typically replaced before the month end reconciliation ran.
- The check was not wrong. It was not often enough to see anything.

2 Money that never finds its owner

- \$1.6 billion sits unclaimed at the Bank of Canada, and more than \$2.5 billion nationally.
- A balance moves there after ten years of failed contact, then is held for thirty years, or a hundred if it is \$1,000 or more.
- It came to rest because nobody could connect a name to a balance.

5 What it looks like when it fails

Four Canadian cases, all published, all in the last seven years. In none of them was the failure detected by the record. In each of them the record is what would have caught it.

QuadrigaCX, 2019	A Canadian platform holding customer money collapsed with \$169 million of client losses across 76,000 investors, roughly forty per cent of them in Ontario. The Ontario Securities Commission attributed about \$115 million of it to fraudulent trading by the chief executive. No independent daily record existed of what the platform actually held.
Bridging Finance, 2021	\$2.09 billion under management at receivership. Investors are expected to lose \$1.3 billion, about sixty two per cent, across 26,000 investors. Reconstructing what the firm had been holding cost \$43 million in professional fees over the first two years, paid out of what was left.
iPro Realty, 2025	\$10 million missing from trust, being \$6.5 million of consumer deposits and \$3.5 million of commission money. The brokerage reported it one day before a scheduled audit. The Real Estate Council of Ontario calls it the largest trust misappropriation since the organisation was founded in 1997. Consumer deposit insurance caps at \$4 million for a single event.
Save Max brokerages, 2025	About \$2.7 million moved out of four trust accounts and used for loan payments, taxes, credit card balances and vendor services. Regulators found the money was typically replaced before the month end reconciliation. Accounts frozen, brokers suspended, registrations proposed for revocation.

Case	What was lost	How it surfaced
QuadrigaCX	\$169M	The company collapsed
Bridging Finance	\$1.3B expected	A receiver was appointed
iPro Realty	\$10M	Self reported, one day before a scheduled audit
Save Max brokerages	\$2.7M	A regulator looked between the monthly checks
Detected by a routine reconciliation	None of them	

Legend. Losses as published by the Ontario Securities Commission, The Globe and Mail and Global News. Every figure on this page is published by the body named beside it and was read on 17 August 2026. Canadian dollars unless stated.

In three of the four, the money was gone for months and the monthly check never saw it

The median internal fraud studied worldwide runs for twelve months before anybody notices, and the single most common cause is that the control did not exist at all. A daily sealed record does not stop somebody taking money. It stops them putting it back before anybody looks.

6 What the software lets a company do for a person

The duty is written for regulators. The value shows up at the counter, in what a business can now tell a customer that it could not tell them before.

The moment	What a customer is told today	What they can be told with a daily sealed record
A house deposit is paid	It is in our trust account.	Here is the account, the balance, the date, and the seal showing this record has not been touched since.
A closing is approaching	We are waiting on funds.	The funds cleared on this day, are held in this account, and the position was proved that night.
A car deposit is taken	We will refund it if the deal does not proceed.	Your deposit is held separately, here is the record of it, and here is what the agreement says happens next.
A loan is approved	It should arrive shortly.	The money left here on this date and is held here now.
Ownership is questioned	Our books say it is yours.	The record of what you were owed on that day, sealed on that day, and provably unaltered since.
A payment is released	Approved.	Approved by this person, at this time, against a position that reconciled that day.

Legend. The right hand column is what the daily record makes possible, not a claim about any specific customer. What changes is not the money. It is whether anybody can prove where it is without asking the business holding it.

The one case where this already works, and what it was worth

In April 2026 roughly \$3.5 million was recovered for a Quebec business after financial institutions detected irregularities between the beneficiary account information and the record. That is the whole mechanism: somebody matched a payment against a record at the moment it mattered. Canadians reported nearly \$31 million of spear phishing losses in the first three months of 2026 alone, and most of those payments met no such check.

1 What the business gains at the same counter

- It answers, instead of promising to look into it.
- The customer's word against its own stops being a risk.
- Regulator, bank or reviewer, the answer is already there.

2 What 4orm Finance never does

- It never holds or moves customer money.
- It signs no filing for anybody.
- The decision is always the firm's. The duty stays where the money is, and so does the signature.

8 How it helps Canada

Canada wrote the rule and then left the proving of it to spreadsheets. The supervisory regime went live on 8 September 2025 with roughly 2,500 firms in scope and an annual regulatory cost of \$24.3 million, set against \$1.19 trillion of debit, credit and online transfer value moving through Canadian payments. All three figures are the Government of Canada's own, published in the Canada Gazette.

A rule that is provable is a rule that works	A duty nobody can evidence is a duty nobody can supervise. Making the proof cheap and automatic is what turns the regulation from a filing into a control.
Supervisors see the position rather than the assertion	The Real Estate Council of Ontario begins collecting trust asset and liability data through its portal from 1 October 2026 and has said it intends to require monthly trust reconciliation reporting in 2027. The direction of travel is towards machine readable proof, on a published timetable.
Enforcement gets cheaper and rarer	FINTRAC, the Financial Transactions and Reports Analysis Centre of Canada, issued 23 notices of violation in the year to 31 March 2025, the most in its history, against 12 the year before. Most of that is record failure rather than criminality.
The money stays in the country's own system	Every product that does this work today is British. A Canadian duty currently has no Canadian answer, and the firms that need it are Canadian.
Built here	Alberta incorporated, Calgary based, and the register it is sold against is the Bank of Canada's own.

What Canada put in place	When	What is still missing
The safeguarding duty and the daily ledger	8 September 2025	Any Canadian software that produces the proof
The public register of payment service providers	8 September 2025	A way to see whether a registrant is actually complying
The annual report to the Bank of Canada	Due 31 March each year	A priced, productised way to discharge it
The independent review, at least every three years	In force	A published fee for one, anywhere in Canada

Legend. Dates from the Bank of Canada, SOR/2023-229 and the Real Estate Council of Ontario. Every figure on this page is published by the body named beside it and was read on 17 August 2026. Canadian dollars unless stated.

Protect the people

That is the line the company is built on, and it is the reason the duty is worth automating rather than merely satisfying. 40rm Finance holds no customer money, signs no filing for a customer, and decides nothing on their behalf. The duty stays where the money is.

9 How it helps the market

A market where nobody can prove a position prices that uncertainty into everything: the banking relationship, the insurance, the cost of capital, the time to close.

1 The network effect nobody has built yet

- A reviewer reading a sealed record needs no new format for each client.
- A bank asked to keep an account open can be shown the position, not told it.
- Lenders and buyers see what is held. No data room.

2 What that changes commercially

- Independent reviewers get access at no charge and are never paid, because a reviewer with a financial interest in the platform is not independent.
- That keeps their opinion worth having, and it is the strongest distribution route in the plan.
- One reviewer reaches many firms.

10 How it helps the companies that buy it

What a firm carries today	Published figure	Source
Payments processing inefficiency, all Canadian business	\$3B to \$6.5B a year	Payments Canada and EY
Of that, money that cannot be matched to a record	\$7.4B to \$13.6B over five years	Payments Canada and EY
Canadian payments that need a human to match them	1 in 4	Payments Canada and EY
Effort spent matching and reconciling payments	0.05 to 15 full time people	Payments Canada and EY
Financial crime compliance cost, United States and Canada	US\$61B a year	LexisNexis Risk Solutions
Time to complete a monthly financial close	8 days, median	APQC, a global benchmark
What a small Canadian firm pays us for the daily record	\$36,813 a year	4orm Finance rate card

Legend. EY is Ernst & Young. The Payments Canada and EY study was published in 2018 and is the most recent Canadian measure of its kind. The LexisNexis figure covers the United States and Canada together, in United States dollars, and no Canada only split is published. Every figure on this page is published by the body named beside it and was read on 17 August 2026. Canadian dollars unless stated.

11 The numbers

The second half of this document is the plan. Everything below traces to the master pro forma, and the three documents behind this one carry the working: the price evidence, the service and price comparison, and the comparables and benchmarks.

\$105.3M	\$108.9M	835	\$3.5M	745	
TOTAL REVENUE IN 2031	RECURRING REVENUE AT 31 DEC 2031	CUSTOMERS AT 2031	THE SEED THIS PLAN RAISES	FIRMS IN THE FIRST POPULATION	
What the plan produces	2027	2028	2029	2030	2031
Subscription, the daily record	\$1,808,948	\$8,773,053	\$21,786,639	\$36,856,947	\$52,279,213
Retention and archive	\$36,179	\$315,830	\$1,045,759	\$2,063,989	\$3,136,753
Evidence reconstruction	\$834,300	\$2,466,000	\$3,657,283	\$2,616,409	\$1,941,306
Review and annual report packs	\$92,798	\$958,847	\$3,458,543	\$6,761,016	\$10,346,903
Second regulator	\$0	\$698,381	\$3,361,507	\$8,222,861	\$13,766,769
Retrieval and usage fees	\$167,700	\$1,706,681	\$5,897,543	\$11,467,739	\$17,035,003
Services, none of it recurring	\$940,000	\$2,833,000	\$4,971,000	\$5,726,000	\$6,771,000
TOTAL REVENUE	\$3,879,925	\$17,751,792	\$44,178,275	\$73,714,961	\$105,276,946

Legend. Six revenue lines, each priced, switched and checked on its own, plus services. Source: 40rm Finance master pro forma of 17 August 2026, base case, Canadian dollars.

TOTAL REVENUE BY YEAR, CANADIAN DOLLARS

2027		\$3.9M	69 customers won
2028		\$17.8M	184 won
2029		\$44.2M	259 won
2030		\$73.7M	214 won
2031		\$105.3M	244 won

Bars start at zero and run to \$105,276,946. Customers won is businesses signed in that year, before any leave. The closing base at 31 December 2031 is 835 end customers plus 31 partners who resell to firms of their own. The gap between the 970 signed across five years and the 835 still there is customers who left.

12 What we found in the numbers

The model was taken apart and rebuilt over the past week. Five things it turned up are worth an investor's attention, and none of them was flattering when it was found.

The plan is overdrawn in eight months before the seed

One month early in 2027, then seven in a row through 2028. The lowest is May 2028 at a shortfall of \$778,960. Drawing the venture debt facility takes it to \$340,891 across five months, so the facility narrows the gap and does not close it. This is stated rather than smoothed, and it is the most important number in the workbook.

The small tier is three quarters of the customers and a fifth of the money

631 of the 835 customers at 2031 sit in the smallest tier, and they carry \$20,666,383 of \$105,276,946. Cutting that price by a fifth costs 4.7 per cent of revenue. The risk in that tier is signing 631 firms, not what each one pays.

A claim was withdrawn rather than defended

An earlier version of the plan targeted 224 firms inside the first three years. That is six signatures a month for twenty five consecutive months from a standing start, and it is not deliverable at any funded headcount. It is withdrawn. The plan reaches 214 firms by 2031, which is 28.7 per cent of the 745 against the 30.1 per cent that was claimed.

Two regulatory claims were removed because they cannot be sourced

The regulation names no first date for an independent review and imposes no period the review must cover. Both were being asserted. Neither is asserted now, and the duty the plan actually sells against is the daily ledger requirement, which is checkable in one click.

The middle of the price ladder was too low

Mid market was priced at the bottom of the observed range rather than inside it. Moving it added \$2,928,718 to 2031 on the same customer count.

1 What was raised

- Mid market moved from the floor of its band to the middle of it.
- Enterprise moved up inside its band.
- The small tier moved up, and its card still sits below the median of every comparable category.

2 What was held, and why

- Command and institution, because its evidence is the thinnest in the ladder.
- Partner and white label, because it has no comparable anywhere.
- Raising a price with nothing behind it adds exposure without adding defence.

None of these was found by an outside reader, and that is the point of publishing them

A plan that has not been attacked from the inside will be attacked from the outside, and the second is more expensive. Every item above changed the model rather than the wording, and the workbook now carries a check against each one so it cannot drift back.

13 What we found in the modelling

The workbook checks itself in sixty five places and fails loudly when two tabs disagree. Nine switches turn whole parts of the plan off so a reader can test it rather than argue about it. Six of the nine are below.

Turn this off	Lowest month on the road	Months overdrawn	What it proves
Nothing, the plan as written	(\$778,960)	8	The base case
Grants and awarded money	(\$1,123,710)	10	The plan does not depend on money nobody has awarded
Research and development credits	(\$1,336,747)	16	The largest single dependency
Services and readiness revenue	(\$670,623)	7	Services are not carrying the road
The second regulator line	(\$624,143)	7	The least evidenced line improves the road when removed
Retrieval and attach meters	(\$820,484)	8	Meters are additive, not structural
Draw the venture debt facility	(\$340,891)	5	The facility narrows the gap and does not close it

Legend. Each row was produced by throwing one switch in the workbook and recalculating every tab. Every case is free of formula errors and every internal check holds. Negatives in parentheses. Source: 4orm Finance master pro forma of 17 August 2026.

Sixty five checks	Eleven on a dedicated tab comparing two other tabs to the dollar, and fifty four more spread across the sheets that produce the figures. Each one names what it compares and what a failure would mean.
What currently reads REVIEW, by design	Two of them. The runway at the seed decision, which is the overdrawn months. And the earnings margin, flagged because the cost base has not been rebuilt for the six revenue lines and must not be quoted yet.

A model that only works one way has not been tested

The value of the switches is not that the plan survives them. It is that a reader can find out for themselves which assumption the plan is leaning on, in about a minute, without asking anybody. On this build the answer is research and development credits, and that is printed above rather than discovered later.

14 What the benchmarks bear

Twenty three products were priced against every line this company charges for, each read on its own published material. The pricing evidence is the separate document behind this one, and the finding is here.

Bars start at zero and run to twenty three, the full set assessed. A product is recorded as not covering a regime when that regime is absent from its own published framework list.

Where the price sits	A small Canadian firm locks \$36,813 from 2028. That is US\$26,532, which is 6.7 per cent above the observed median contract for the nearest comparable category and below the ceiling of every band it is measured against.
What the market already supports	Workiva reports 2,690 of its 6,750 customers paying more than US\$100,000 a year, and 276 above US\$500,000. The shape of this ladder is one the market is already paying for, in products that assemble filings rather than hold a funds position.
The one tier with no benchmark	Partner and white label. No published comparable exists for a reviewer or association channel in any market, and the documents say so rather than reaching for a proxy.

Tier	What a customer locks	Nearest published comparable
Command and institution	\$858,750	MetricStream mid market licence band
Enterprise and complex	\$274,375	AuditBoard enterprise band
Mid market regulated	\$104,063	AuditBoard mid programme band
Small regulated firm	\$36,813	Drata observed median contract
Partner and white label	\$162,500	None found in any market

Legend. What a customer locks is the price a firm signing from 1 January 2028 keeps for as long as it stays. Comparables are converted at the Bank of Canada rate of 14 August 2026. Source: 4orm Finance master pro forma of 17 August 2026.

15 Market share, and how it is measured

Share is stated against a named population and never blended, because a share across eleven industries at once flatters everybody and means nothing. The first population is the 745 registered Canadian payment businesses that actually hold customer money.

Measure	Figure	What it is
Registered payment service providers	1,562	The whole Bank of Canada register
Of those, holding customer funds	745	The population the duty attaches to
In the application queue	459	Held out of the count until they are registered
Held at 2031, on this plan	214	Of the 745
Share of the fund holding population at 2031	28.7%	Customers divided by 745
Every entity on the register	18,254	Every industry the product reaches
Share across every industry, 2031	4.7%	865 customers and partners against 18,254. Shown because a reader will work it out, never as the headline

Legend. The 745 is split across four size bands so no firm is counted twice. Share is customers held at 31 December divided by the population of that segment. Source: 4orm Finance master pro forma of 17 August 2026 and the Bank of Canada retail payments registry.

What comparable companies actually reached, against their own populations

Workiva reached about 14 per cent of its registry defined population in its first year. Avalara reached an upper bound near 24 per cent. Verafin reached 31 per cent across North American deposit taking institutions. OneTrust reached about 0.4 per cent. Each is taken from that company's own filings and compiled in the precedent evidence behind this plan. A target of 28.7 per cent by 2031 sits above the early curve and below the best outcome observed, which is where a plan should sit if it is going to be believed.

SHARE REACHED AGAINST A NAMED POPULATION, PER CENT

Bars start at zero and run to 31 per cent. Each company is measured against its own named population, never against a blended market. Comparable figures from the precedent evidence behind this plan.

16 The road to the end line

Five things have to happen in order. Each one retires a specific objection, and none of them is retired by argument.

Close the pre seed and sign the first customers	Two design partners into paying customers, and the first daily record produced and accepted. The plan signs 69 customers in 2027 and reaches \$3,879,925 of revenue.
Get through the overdrawn months	One in early 2027 and seven in a row through 2028. May 2028 is the low point at \$778,960. The facility narrows it to \$340,891 across five months. This needs the most attention of anything in the plan, and it is on the face of the model rather than in a footnote.
Raise the seed on evidence rather than on a deck	\$3.5 million raised at a \$30.0 million valuation after the money, priced against recurring revenue of \$19,486,034 at the end of 2028, which is 1.5 times. Three signed enterprise contracts and one completed independent review that used our evidence pack retire the pricing and the product objections. Nothing else retires either.
Prove the second regulator line before quoting it	It carries \$13,766,769 in 2031 and rests on a share of customers with a second duty for which no published Canadian figure exists. It should stay switched off in any conversation until a customer signs.
Reach 2031 at \$105,276,946 and 835 customers	Recurring revenue of \$108,935,933 at the 2031 year end, 28.7 per cent of the 745, and a product outside reviewers have by then examined on behalf of hundreds of firms.

1 What would have to be true for this to be wrong

- A British specialist localises for Canada before we have signed contracts.
- The share of customers carrying a second regulated duty is lower than modelled.
- Firms wait for a reviewer to arrive before buying the reconstruction.
- An adviser productises a fixed price pack before we do.

2 What answers all four

- Three signed Canadian contracts at the enterprise tier.
- One completed independent review that used our evidence pack.
- One named second regulator customer.
- None of them is answered by a better argument.

What the company is actually selling

Not compliance software. The ability of a business to answer, on any day, a question it cannot answer today: whose money is this, how much of it is there, and can you prove that record has not been touched. Every number in this document exists because that question currently has no good answer in Canada.

British Columbia brokerage reconciliation	BC Financial Services Authority	Primary
Law firm trust rules	Law Society of Ontario , British Columbia and Alberta	Primary
Consumer deposit insurance caps	Real Estate Council of Ontario	Primary
2,500 firms in scope and the \$1.19 trillion flow	Canada Gazette, Part II, November 2023	Primary
The daily ledger duty and the review	Justice Laws, SOR/2023-229	Primary
The registry going live	Bank of Canada	Primary
How unclaimed balances accumulate, and the total	Financial Consumer Agency of Canada , and the reported total	Mixed
Payments processing cost and reconciliation effort	Payments Canada with EY, 2018	Secondary

Legend. Primary means a regulator, a statute, an official register or an issuer release. Secondary means reputable press or a research house. Mixed means the data is official and the total was reported by a third party. Every publisher above is a link. Read on 17 August 2026. Continued overleaf.

18 What this document deliberately does not do

Three things a reader might expect to find here are absent, and each is absent for a reason worth saying rather than leaving to be discovered.

No first date for an independent review	SOR/2023-229 section 17 requires a review at least once every three years and imposes no period the review must cover. The regulation names no first date and neither does any Bank of Canada page. Any date a reader wants is arithmetic from 8 September 2025, and it is offered as arithmetic.
No total for money held in Canadian trust accounts	None is published, nationally or by province, for real estate brokerages, law firms or payment providers. What is published is the interest those accounts throw off, which funds a \$58.9 million granting programme in Ontario alone.
No claim that any comparable is a competitor	None of the twenty three products priced against this plan sells against the Canadian safeguarding duty. They establish what a firm of each size pays for software of roughly this weight, which is a different question from who else a buyer is considering.

What was taken	Publisher, click to open	Class
Delayed closing compensation, \$150 a day	Tarion	Primary
Vehicle deposit claims paid, and the refund rule	Ontario Motor Vehicle Industry Council , and cancelling an agreement	Primary
Financial crime compliance cost, United States and Canada	LexisNexis Risk Solutions	Secondary
Median twelve month fraud duration before detection	Association of Certified Fraud Examiners	Secondary
Median eight day monthly financial close	APQC	Secondary
Customers above US\$100,000 and US\$500,000 a year	Workiva	Primary
Every figure about this plan, and every one behind it	4orm Finance master pro forma of 17 August 2026	Model

Legend. Continued from the previous page. Model means the figure comes from our own workbook and can be recalculated by anybody holding it.

The standard this document holds itself to

Every figure is published by the body named beside it, every source opens in one click, and every claim about this plan can be recalculated in the workbook it came from. Where a number a reader might expect does not exist, this document says so rather than reaching for the nearest thing that does.
