

Twelve documents, and the order to read them

Every figure in this folder comes out of one workbook, the master pro forma rebuild. Nothing is typed twice and nothing is estimated to fill a gap. This page says what each document holds, so a reader can go straight to the question they came with.

SWITCHES THAT TURN
PARTS OF THE PLAN OFF

1 What each document holds

	Document	What it answers
05.1	The plan in one table	Capital in, customers, revenue, margin, earnings, cash, runway and headcount, across all six years
05.2	The revenue build	Six lines, each with its price, its attachment ramp and its own switch
05.3	The market, the card and the denominator	The price ladder, the four ways the market is sized, and the population every share is measured against
05.4	Customers, cohorts and capacity	New logos by tier, churn, the closing base, and whether the team can deliver the ramp
05.5	Unit economics	What one customer is worth, what one costs, and how many are needed to break even
05.6	The cost base	Where every dollar of cost goes, who is permitted to build what, and the headcount behind it
05.7	Profit, cash and runway	The profit and loss, the tax, the cash statement and the ten funding tests
05.8	The road to the seed	Twenty nine months, the eight overdrawn ones, and what the facility does
05.9	Capital structure and the round	Five instalments and what releases each, and what the round costs in ownership
05.10	Investor returns	The distribution, the hurdle, and what comes back on three horizons
05.11	How the model checks itself	The sixty five checks, the nine switches, and the source register

Legend. Read 05.1 first. A reader who stops there understands the plan. 05.8 and 05.11 are the two that answer a sceptic rather than a browser.

How to read a number in this folder

Four conventions hold across every document, and they are worth a minute before the first table.

Every figure traces to the workbook	If a number is not in the master pro forma it does not appear here. Nothing is estimated to fill a gap, and where a figure a reader might expect does not exist, the document says so rather than reaching for the nearest thing.
Negatives sit in parentheses	A cash low point of \$778,960 appears as (\$778,960). Every table that carries one says so in its legend.
Share is stated against a named population	Never blended. A share across eleven industries at once flatters everybody and means nothing, so each one names the group it is measured against.
The base case is the only case shown	Nine switches turn parts of the plan off and one selector moves the scenario. Every figure in this folder is the base case with every line switched on, and 05.11 shows what happens when they are not.

2 What the plan reaches, and the three tests behind it

1 The plan \$105,276,946 of revenue in 2031 on 835 customers and 47 people, first profit in 2028, and \$86,616,099 of cash at the end before any distribution.	2 The road Eight months overdrawn before the seed, the lowest at (\$778,960) in May 2028. Printed on the face of the model rather than in a footnote.	3 The evidence Twelve checks on a dedicated tab and fifty four more across the sheets. Two read REVIEW by design, and 05.11 names both.
--	---	---

A model that only works one way has not been tested.

The switches are in the workbook so a reader can find out for themselves which assumption the plan leans on, in about a minute, without asking anybody. On this build the answer is the research and development credits.
