

What the price is, and what would make it wrong

Two subscriptions are priced. Twenty five cents values 4orm Finance at \$5,000,000 before the money, and fifty cents at \$10,600,000 after it. This paper sets out the arithmetic behind both, tests each price against what Canadian money paid at this stage, and states the five things that would make the price wrong. It is written to be argued with.

1 The arithmetic, in full

Step	Price a share	Shares	Money in	Before	After	Of the company
Founding shares issued	Nil	20,000,000	n/a	n/a	n/a	94.34%
Angel subscribes	\$0.25	200,000	\$50,000	\$5,000,000	\$5,050,000	0.94%
First pre-seed instalment subscribes	\$0.50	1,000,000	\$500,000	\$10,100,000	\$10,600,000	4.72%
Outstanding after both		21,200,000	\$550,000		\$10,600,000	100%

Legend. Twenty million founding shares at twenty five cents is \$5,000,000, and fifty cents is twice it. The founder holds 16,020,000 of the 21,200,000, which is 75.57 per cent before any outside money. Three further instalments of \$500,000 carry no price today: they are agreements for future equity at ceilings of \$15,000,000, \$18,000,000 and \$20,000,000, each with a fifteen per cent discount and most favoured nation terms. What the fifty cent price is actually being asked against

A price is a multiple of something. At this stage there is no revenue to divide by, so the honest first answer is that today's price divides by zero and any multiple quoted against it is a multiple of a forecast. The table below sets out what each step in the ladder would be a multiple of, using the recurring revenue the plan itself produces in the year before that step is asked for.

The step	When	Price or ceiling	Recurring revenue the year before	Multiple of it
Angel, twenty five cents	Aug 2026	\$5,000,000	Nil	n/a
First instalment, fifty cents	Aug 2026	\$10,600,000	Nil	n/a
Second instalment, ceiling	Oct to Nov 2026	\$15,000,000	Nil	n/a
Third instalment, ceiling	Feb to Mar 2027	\$18,000,000	Nil	n/a
Fourth instalment, ceiling	Apr to May 2027	\$20,000,000	Nil	n/a
Seed round, priced	Q4 2028	\$30,000,000	\$19,486,034	1.54x

Legend. A ceiling is not a valuation. It is the highest price at which that money is allowed to convert, and a lower ceiling favours the investor. The only step in the ladder with revenue behind it is the seed, and 1.54 times recurring revenue is modest against every comparable in this paper. Every step before it is priced on what has been built rather than on what has been sold. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, capital structure and seed timing tabs.

1 What the ladder is paid for

- The second instalment releases on the architecture note accepted, twenty discovery calls done and two design partners signed.
- The third releases on both partners live in production and a first paying subscription customer signed.
- The fourth releases on \$10,000 a month of recurring revenue across at least five paying customers.

2 What that means for a reader

- No step after the first two is paid for by time. Each is paid for by something that either happened or did not.
- A step that does not release is money that does not arrive, and the road already goes negative in February 2027.
- Three of the five instalments have no investor named as at August 2026.

The five things that would make this price wrong

Each is a figure the plan produces about itself rather than an objection a reader has to find. Two of them are checks inside the workbook that read REVIEW by design.

What it is	The figure	Why it bears on the price
The road is overdrawn in eight months before the seed	Lowest May 2028 at \$778,960 short	One month early in 2027, then seven in a row through 2028. Drawing the \$500,000 facility narrows it to \$340,891 across five months and does not close it. A price agreed today is agreed on a plan that needs something more than the money in front of it
Runway at the seed decision is about one month	1.06 months, against a twelve month threshold	Three tabs call twelve months the warning threshold for opening a raise, and one check enforces it. A company opening a round with a month of cost in hand has no ability to decline a price
There is no customer, and none of the plan is contracted	Nil revenue, nil signed contracts	Every figure past today is a management estimate. The first paying customer is a Q1 2027 milestone and the ten reference customers the seed is raised on are Q1 2028
The most expensive tier has the thinnest evidence	0 of 3 rows primary sourced at \$687,000	The command and institution tier holds 65 entities, none of its three register rows is primary sourced, and it carries \$44,655,000 of the recurring market. The partner tier has no published comparable in any market
The earnings margin cannot be quoted yet	Check reads REVIEW	The cost base has not been rebuilt for six revenue lines, so revenue rises while staff, delivery and channel costs do not. The workbook says the margin must not be quoted, and it is not quoted here

Legend. Two of the workbook's twelve reconciliations read REVIEW: runway at the seed decision, and no month inside a year overdrawn. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, checks, map to seed, population register and revenue lines tabs.

The price should be tested against these five rather than against the comparables.

Comparables say what this category has been worth when it worked. They cannot say what a company with no revenue is worth today, and a reader who prices off them is pricing off somebody else's execution. The five figures above are the ones that decide whether this plan reaches the point where a comparable becomes relevant at all.

What Canadian money paid at this stage

Two different questions sit in this section and they are worth keeping apart. The first is the size of a Canadian cheque at this stage, which the five rounds below answer. The second is the price it was paid at, which none of them disclosed, because no Canadian company at this stage discloses one. The bands are the only price evidence available and they are medians rather than a range.

THE FIVE ROUNDS, DRAWN TO ONE SCALE

Trusty		\$1,000,000	Pre-seed, 2025
Slate		\$1,300,000	Pre-seed, Jan 2026
4orm Finance		\$2,050,000	Pre-seed, Aug 2026 to May 2027
Finofo		\$3,300,000	Seed, Jun 2025
SimpleHedge		\$4,000,000	Seed, Dec 2025

Bars start at zero and run to \$4,000,000, the largest of the five. **None of the five disclosed a valuation**, so this is the size of the cheque and not the price it was paid at. This round is larger than the two Canadian pre-seeds and smaller than the two Canadian seeds, which is where a round asked to carry a company from a design pack to ten paying customers sits. Sources: BetaKit, Calgary.Tech and Fintech.ca, as recorded on the capital structure tab.

1

The price bands

- Median pre-seed value in 2026, \$5,000,000 to \$6,000,000. Twenty five cents sits inside it. Fifty cents sits above it.
- Median seed value in 2026, \$24,000,000. The planned round at \$30,000,000 is 25 per cent above it, two years out.
- 93 per cent of pre-priced deals in the fourth quarter of 2025 were agreements for future equity, and about two thirds carried a ceiling and no discount. These carry both.

2

The market these were raised into

- 45 Canadian pre-seed deals in the first half of 2025 totalling \$33,200,000, an average of \$740,000 a deal.
- Alberta took 7 of those deals and \$4,600,000, against Ontario at \$16,400,000 across 18. Alberta is thin at this stage, which is why this round is structured in five instalments rather than one close.
- Companies actively raising fell from 162 in January 2025 to 61 in March 2026, out of more than seven hundred tracked.

The five rounds	BetaKit, Calgary.Tech and Fintech.ca. Two of the four comparators are Calgary companies. 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, capital structure tab.	SECONDARY

The three ceilings, tested in both directions

A ceiling only matters at the moment the next round is priced, and it cuts two ways. If the round prices above the ceiling, the ceiling binds and the early money converts cheaply, taking more of the company. If the round prices below it, the ceiling is irrelevant and the money converts on the fifteen per cent discount instead. Both cases are set out below, on the plan's own figures.

THE CEILING MONEY IS NORMALLY OFFERED AT, BY SIZE OF RAISE

Bars start at zero and run to \$30,000,000. The three instalments here total \$1,500,000, which places this round in the one to two and a half million band, whose normal ceiling is **\$15,000,000**. The first ceiling here is \$15,000,000. Carta, State of Private Markets as reported August 2026, and State of Pre-Seed, fourth quarter of 2025. The master source register carries no live link for either, so neither is linked here.

If the seed prices at	The ceilings	The three instalments take	Seed investors take	The founder keeps
\$30,000,000 post-money, the plan's own figure	Bind	8.61%	11.67%	52.69%
\$8,414,163, what 2027 evidence would imply	Do not bind	20.97%	41.60%	20.73%

Legend. The multiple barely moves between those two rows: 1.54 times the recurring revenue at the end of 2028 against 2.00 times at the end of 2027. What moves is the revenue behind it, which is four and a half times larger a year later on the same team and the same product. A ten per cent option pool is created out of the pre-money in both cases. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, seed timing and pricing tab.

The market, counted rather than estimated

The register holds 18,254 Canadian entities across five mutually exclusive tiers and eleven industries, built entity by entity at the published card rather than from the top down. The honest qualification sits beside it: **13 of the 32 rows behind that register are primary sourced and 18 of 31 are management estimates**, which means any share measured against one of the estimated rows is a ratio with an estimated denominator.

FOUR NUMBERS, EACH SMALLER THAN THE ONE ABOVE IT

Fully penetrated ceiling		\$1,770,732,455	never a denominator
Recurring market at the card		\$840,471,950	the headline
Budget qualified in the near term		\$490,572,719	the five year target list
The 745 fund holders, priced on the card		\$72,179,000	the group led with

Bars start at zero and run to \$1,770,732,455. The ceiling is the whole recurring market multiplied by a judgement about premium add-ons and **no share is ever measured against it**. The headline is \$840,471,950, built from the card with a \$91,492,500 overlap deduction so a firm served through a partner is not counted twice. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, market by layer tab.

The first population	745 registered payment service providers that hold end user funds, out of 1,562 registered, with 459 in review held outside the denominator. The duty attaches to holding the money rather than to being registered, and the register is public.
What the plan takes of it	214 firms by 2031, which is 28.7 per cent of the 745. About 60 firms, or 8.1 per cent, three years after the duty commenced.
What is held out on purpose	Consumer driven banking, 578 entities, at zero revenue, because the rules were published in draft in June 2026 and no register of approved firms exists. The 459 applicants in review carry no price either.
The figure never published	Blended capture across the whole register is 4.7 per cent. It exists so the arithmetic ties and it is never the headline, because one average across eleven industries invites the comparison with a company that grew fastest in America and still landed at 0.4 per cent.

The card, against what buyers actually paid

One price per size band, held flat for the life of the model. It steps once, on 1 January 2028, and a firm keeps the price it signed at for as long as it stays, so the 2027 column is a closing price rather than a discount. The comparison below is made on the locked price a firm signing from 2028 pays, against observed contract figures and published lists rather than against rate cards, because sixteen of the twenty three products checked publish nothing at all.

WHAT A FIRM LOCKS, SIGNING FROM 1 JANUARY 2028

Command and institution		\$858,750	no published comparable found
Enterprise and complex		\$274,375	against an enterprise band
Partner and white label		\$162,500	no comparable in any market
Mid market regulated		\$104,063	against a mid programme band
Small regulated firm		\$36,813	6.7% above the observed median

Bars start at zero and run to \$858,750. The small tier carries the plan: 631 of the 835 customers at 2031 and \$20,666,383 of the revenue, and at US\$26,532 it sits **6.7 per cent above the observed median contract** for the nearest comparable category and below the ceiling of every band it is measured against. Foreign figures converted at [the Bank of Canada daily rate of 14 August 2026](#), 1.3875. Source: 4orm Finance Price Evidence, all tiers, 17 August 2026.

1

Where the evidence is strongest

- The small tier is tested hardest because it carries the plan, and it is checked against observed contracts across 127 deals rather than a list price.
- Mid market and enterprise sit inside published bands for products of roughly this weight.
- A bank's digital finance team said in a meeting on 7 August 2026 that other providers quote about \$100,000 a year for reserve reporting alone. That is one person's view, there is no agreement, and it is carried here as one price point rather than as validation.

2

Where it is weakest

- Command and institution is the highest price in the card and the thinnest evidence in the register, with none of its three rows primary sourced.
- Partner and white label has no published comparable in any market, and the documents say so rather than reaching for a proxy.
- Two prices were held rather than raised in the 17 August rebuild for exactly that reason: raising a price with nothing behind it adds exposure without adding defence.

What the plan produces, and what it does not claim

	2027	2028	2029	2030	2031
Total revenue	\$3,879,925	\$17,751,792	\$44,178,275	\$73,714,961	\$105,276,946
Recurring revenue at 31 December	\$4,211,249	\$19,486,034	\$47,184,419	\$75,489,091	\$108,935,933
Customers live at year end	65	238	473	645	835
Employees	12	23	32	38	47
Contracted delivery, full time equivalents	10.4	29.2	52.3	64.2	79.1
Gross margin	64.3%	69.9%	73.6%	76.5%	77.6%
Net profit after tax	(\$4,315)	\$4,431,553	\$15,434,828	\$29,628,804	\$45,022,743

Legend. Six revenue lines, each with its own price, take-up rate and switch, plus services which do not recur. 2026 is a five month year and is left off this table. First profitable year is 2028. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, revenue model, team roadmap and profit and loss tabs.

REVENUE AND PROFIT AFTER TAX, ON ONE SCALE

Bars start at zero and run to \$105,276,946, with customers live at year end of 65, 238, 473, 645 and 835 underneath. The plan spends ahead of revenue through 2027 and turns profitable in 2028. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full.

Three figures on this page are held back rather than quoted.

The earnings margin, because the cost base has not been rebuilt for six revenue lines and the workbook's own check says it must not be quoted. The second rule maker line, \$13,766,769 in 2031, because no published Canadian figure exists for the share of customers owing proof twice and it should be switched off until such a customer signs. And the retrieval meters, \$17,035,003, which the workbook names as the assumption with the least support behind it.

What the shares could be worth, and what that number rests on

Buyers of software companies price them on recurring revenue rather than on profit: the money that arrives every year from customers already signed, without selling to them again. The table below applies a range of observed multiples to the \$108,935,933 of recurring revenue the plan reaches at the end of 2031. **Every figure in it is arithmetic on a plan that has no customers today, and it is offered as arithmetic.**

COMPANY VALUE AT 2031 RECURRING REVENUE OF \$108,935,933

6 times		\$653,615,598	nCino trades at 6.6x revenue
8 times		\$871,487,465	Adyen at 8.1x. Carried in the model
11 times		\$1,198,295,264	Vanta and Pagero changed hands here
15 times		\$1,634,038,996	AuditBoard at 15x
19.5 times		\$2,124,250,695	Verafin, the top of the observed band

Bars start at zero and run to \$2,124,250,695. **The model carries eight times, deliberately the second lowest of the five**, so nothing in the return figures assumes a top of band outcome. At eight times, one \$500,000 subscription at fifty cents is worth \$28,661,341 on paper. The multiples are what buyers paid for firms with revenue, customers and a record. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, investor returns tab.

Named transactions behind the band	Nasdaq acquired Verafin for US\$2.75B at roughly 19.5 times forward revenue, on 98 per cent client retention (CNBC ; Nasdaq). Hg acquired AuditBoard at more than US\$3B on more than US\$200M of recurring revenue (Hg). Thomson Reuters paid roughly US\$800M for Pagero (International Accounting Bulletin).
The counter-example in the same band	Tungsten carried the same mandate exposure as Pagero, served 74 per cent of the FTSE 100, saw revenue fall and sold for about GBP 70.6M (Canaccord Genuity). Mandate exposure is not the same as a multiple.
How long it took the firms that got there	Bessemer's Cloud 100 average is 7.5 years to US\$100M of recurring revenue (Bessemer). Verafin reached about 31 per cent of its named population after roughly twenty three years (Verafin). This plan reaches \$108,935,933 in five.
What none of it says	None of these firms sells against the Canadian safeguarding duty, and none of them was valued at this stage on this evidence. They establish what the category is worth when it works. They do not establish what this company is worth today.

SOURCES ON THIS PAGE

If the company is held rather than sold

A second route to a return exists and it does not require a sale. The company pays out forty per cent of net profit after tax across 2029 to 2038, and the order it is paid in is the part worth reading: **the investors are paid first and in full until they have had four times their money back in cash, and the founding shares receive nothing at all before that.** On this plan the hurdle of \$22,200,000 clears part way through 2031.

What each instalment holds and is paid	Invested	Held after the seed	Cash 2029 to 2038	Cash on cash
Angel, at twenty five cents	\$50,000	0.66%	\$2,333,119	46.7x
First instalment, at fifty cents	\$500,000	3.29%	\$11,665,597	23.3x
Second instalment, \$15,000,000 ceiling	\$500,000	3.33%	\$11,823,617	23.6x
Third instalment, \$18,000,000 ceiling	\$500,000	2.78%	\$9,853,014	19.7x
Fourth instalment, \$20,000,000 ceiling	\$500,000	2.50%	\$8,867,713	17.7x
Seed, 2028	\$3,500,000	11.67%	\$41,382,660	11.8x
All investors together	\$5,550,000	24.22%	\$85,925,720	15.5x

Legend. Cash on cash counts the distribution only and assumes no sale. A ten per cent option pool is created at the seed and receives nothing in any year, because an option is not a share. The payout rate is a decision for the board of the day and nothing in the plan commits the company to it. Source: 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, investor returns and ten year model tabs.

1 What the payout is

- Forty per cent of net profit after tax, paid only in a profitable year and only when the board declares it.
- Nil in 2026, 2027 and 2028, because there is no profit after tax to pay from until 2028 and the first distribution year is 2029.
- \$258,958,560 payable in total across both bands on these assumptions, of which \$85,925,720 reaches the investors and the balance the founding shares.

2 What it is not

- It is not a return on its own. The figures arrive slowly and the first one is three years out.
- Every dollar paid out is a dollar not spent winning the next customer, in a market of 18,254 firms with no established supplier.
- The four years past 2031 rest on three inputs stated on the tab: revenue growth stepping down to 12 per cent, cost of revenue at 25 per cent, and operating expenses growing at 85 per cent of revenue growth.

SOURCES ON THIS PAGE

The distribution and the hurdle	Forty per cent of net profit after tax 2029 to 2038, a hurdle of four times capital at \$22,200,000, cleared part way through 2031, with the founding shares receiving nothing before it. 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, investor returns tab, section 4.	MODEL
The four extended years	2032 to 2035 carried forward on three stated inputs. 2036 to 2038 held flat at the 2035 figure rather than grown. 4orm Finance master pro forma rebuild of 16 August 2026, base case, recalculated in full, ten year model tab.	MODEL

What is not claimed, and who is on the file

1

No revenue and no customer

- No software live and no paying buyer as at August 2026.
- The build partner is at signed letter of intent, converting to a final agreement on deposit, with the assignment of the intellectual property inside that final agreement. Until the deposit is made there is a letter and nothing beyond it.
- Every figure past today is a management estimate from the base case.

2

No agreement with any institution

- Conversations exist with a bank's digital finance team, a credit union, a regulated payment firm and an exempt market dealer.
- None has committed to anything and none is counted as revenue, a customer, a channel or committed capital.
- The bank quote of about \$100,000 a year is one person's account of what another provider charges a client of theirs.

3

Nothing beyond the first product

- One product, one regulator, one population. No revenue from any later market appears in any figure in this paper or in the price of this round.
- Consumer driven banking is held out of the register entirely, 578 entities at zero revenue, because no register of approved firms exists.
- Comparables establish what the category is worth when it works, not what this company is worth today.

THE ROLES THAT BEAR ON A PRICE, AND WHAT EACH ONE MAY NOT DO

Company and share law

Partner in technology law at a national firm serving regulated financial businesses. A regulated buyer's own counsel asks who advised on the set up before it asks about the software.

Securities counsel

Advises on the instrument. Sits on a provincial securities commission forum.

Capital markets

Access to the next round. A company with a named route to its next round is a different risk from one without.

Systems design and controls

Owns the target design and the control set an outside reviewer reads first. Cannot author rule content.

The build partner, standing in as technical chief

Carries the technical seat while the build runs. An external team starts on signature and stops on completion, which is why the plan reaches a working product on a pre-seed rather than needing a seed to begin. A supplier, not a shareholder and not an investor.

The founder

Sets the price, sets what the company will and will not build, and says no. Cannot author rule content and cannot approve a release alone.

The eight questions to put back

A valuation review that cannot be argued with is a sales document. These are the questions this paper is built to be asked, in the order they bear on the price, with the page each one is answered on.

What is the fifty cent price a multiple of?	Nothing yet. There is no revenue to divide by, and every multiple in this paper is a multiple of a forecast. Page 2 states what each step would be a multiple of, and only the seed has revenue behind it.
The road is short of cash in eight months. What closes it?	Not the borrowing facility, which narrows the lowest month to \$340,891 short across five months. A larger first round, slower spending, or an earlier seed, and the last of those reprices the company against a quarter of the revenue. Pages 3 and 5.
Why should a ceiling of \$15,000,000 be accepted?	Because it is the ceiling money is normally offered at for a raise of this size, and because it carries a fifteen per cent discount that about two thirds of comparable instruments do not. Page 5, in both directions.
The 745 is a register. What is the other 17,509?	Thirteen of the thirty two rows behind the register are primary sourced. The 745 is the group the plan leads with because it is public and named. Page 6 states which rows are estimates.
The command tier is the highest price and the thinnest evidence. Why keep it?	It carries \$44,655,000 of the recurring market and \$3,800,355 of 2031 revenue on three unsourced register rows. Two prices were held rather than raised in the last rebuild for that reason. Page 7.
Why is the earnings margin missing?	Because the workbook's own check on it reads REVIEW: the cost base has not been rebuilt for six revenue lines. It is not quoted anywhere in this paper. Pages 3 and 8.
Why does the multiple table start at six times?	It runs from six to 19.5 and the model carries eight, deliberately the second lowest. Page 9 names the transaction behind each one and the counter-example in the same band that sold for a tenth of the price.
What does an investor get if nobody ever sells?	Forty per cent of profit after tax from 2029, paid to the investors first and in full until they have had four times their money back, with the founding shares receiving nothing before that. Page 10.
