

Invention Disclosure Record, Evidence Store

Prepared to be handed to patent counsel. It gathers what the written record already supports, sets out the closest known art, and names the detail only the inventors can supply. Where a section is unfinished, it is marked unfinished rather than filled with something plausible.

6	4	11	None
SECTIONS COUNSEL CAN USE TODAY	SECTIONS NEEDING INVENTOR INPUT	QUESTIONS ONLY THE INVENTOR CAN ANSWER	FILING DATE ON RECORD

DISCLOSURE TIER Counsel	Who reads it. Patent counsel, the named inventors, and the company's own file. It does not leave the company and it is not placed in the data room at any tier. What it says. The subject matter under consideration, the record of conception, the closest known art, the ownership chain, and the disclosure log. What it holds back. Nothing. This is the one tier where nothing is held back. Where a detail is absent it is absent because nobody has written it down yet, and that gap is named.
-----------------------------------	--

1 How to use this document

SOURCES ON THIS PAGE

Architecture Pack. Architecture Pack, 4orm Finance, 5 August 2026, 21 pages, the primary written record of the design

Filing status. Confirmed by Chad Johnston, 17 August 2026: application in preparation with counsel, no date on record

The subject matter, stated plainly

An evidence store for regulated record keeping in which stored records cannot be changed or removed, corrections are admitted as new records that preserve the integrity of what came before, and the whole of a past period can be produced again, at a later date, in a form that is identical to the earlier production.

That last clause is the one doing the work. Several systems make a store tamper evident. Producing the same period twice, separated by a year, and landing on identical output is a different and harder requirement, and it is what a regulator's outside reviewer actually tests.

2 The field, and what the software is for

Field	Record keeping software for regulated firms that hold money belonging to other people, where a supervisory authority may examine a named past day long after that day has passed.
The commercial setting	Canadian payment service providers have owed a daily safeguarding proof since 8 September 2025, with an independent review falling due in September 2028 that looks back three years. The same shape of duty sits on provincial trust accounts.
The technical challenge	An examiner asks what a firm held on a named day, under the rule in force on that day. Ordinary record keeping answers with today's state under today's rule. Systems that do keep history usually cannot prove that the history itself has gone unaltered, and almost none can produce the same past period twice and land on the same output.
Why it matters commercially	The proof is worth what an examiner will accept. A history a reviewer cannot independently check is worth close to nothing at the moment it is needed.

The claim is about producing the past again, not about storing it.

Storage that resists tampering is well travelled ground. Reproducing a period identically, twice, a year apart, under the rule that applied at the time, is the part the written record suggests is new.

3 What a reviewer is actually testing

No part of that test asks the reviewer to trust our software. That is the difference between this and a system that verifies its own records by computing a digest and telling the reviewer the digest matches.

Architecture Pack. Sections 3, 12 and 14, the three differences, the life of a record, and the one step test

The elements, and how much of each the written record supports

Counsel will want to know which elements are already documented with a date behind them and which exist only in the inventors' heads. The right hand column is the honest answer.

Element	What the written record shows	Status
A. Records are added and never changed or removed, enforced by the store rather than by a policy above it	Stated as a design refusal, with the failure path written out. No change path and no delete path anywhere in the code	Documented
B. Each record is fingerprinted from its own content and locked to the record before it	Two fields are named in the record shape and the chain is drawn across three consecutive days	Documented
C. A correction is admitted as a new record that supersedes an earlier one, leaving the earlier one readable and the chain sound	The supersede field is named and the behaviour is stated. The mechanism that keeps the chain sound across a supersede is not written down	Partly documented
D. Each record binds the day it is about, the day it was written, and the version of the rule in force on the first of those	Fully drawn, with a worked example across a rule change on 26 March 2026	Documented
E. A past period can be produced again at a later date and is identical to the earlier production, byte for byte	Stated as the one step test and as an automatic check on every code change. The serialisation that makes it deterministic is not written down anywhere	Not documented
F. Records for different customers are held under separate keys beneath the chain	Stated at the platform layer. How key separation and the chain interact is not written down	Partly documented

Legend. Elements A, B and D are supported by a dated document. C and F are asserted but not explained. E is the element most likely to carry the claim and is the least written down, which is the single most urgent gap on this page.

MOST URGENT GAP

Element E is the gap that matters. The one step test appears in the Architecture Pack as a commitment and as a build gate. Nowhere in the written record is there an account of how records are ordered, encoded, and what is excluded from the fingerprint, such that two independent productions of the same period agree exactly. Until an inventor writes that down, counsel is drafting around a hole in the middle of the strongest element.

Elements are lettered A to F throughout this document and the letters are used again on page seven, where each open question is tied back to the element it would settle, and on page nine, where each disclosure is tied to the elements it carried.

Architecture Pack. Sections 11, 12, 13 and 14

Conception and reduction to practice, as the record stands

Counsel will ask when the idea was formed, by whom, and what evidence carries a date. Everything below is drawn from documents in the company's own folder. Anything earlier than 5 August 2026 needs an inventor to point at the file.

Date	Evidence	What it establishes
Jun 2026	Technical architecture brief, tech stack decisions, domain glossary and data model	Design work under way. Whether the add only and chaining elements appear in these needs checking by an inventor
31 Jul 2026	Architecture pack, first edition	An earlier written form of the same architecture. Its treatment of the store needs comparing against the 5 August edition
5 Aug 2026	Architecture pack, 21 pages	The clearest written record. Names the fingerprint fields, draws the chain across three days, states the one step test, and sets the build order
6 Aug 2026	Architecture pack, Speer edition	A variant. Which elements it carries needs confirming against the file
13 Aug 2026	Mutual NDA, 4orm Finance and Speer Technologies	The first signed confidentiality obligation identified in the folder
17 Aug 2026	This record	The company's own dated statement of the subject matter

Legend. Conception can predate any of these. Reduction to practice has not occurred, since no part of the evidence store is built. A constructive reduction to practice by filing is the route available.

4 Three things worth doing now

1 Read the June briefs

Three of them predate the pack. If one describes the store, the conception date moves back six weeks at no cost.

2 Compare the two packs

Whichever of the 31 July and 5 August editions first carries elements A, B and E is the document counsel will lean on.

3 Write the inventors down

Who conceived which element, and when, in a dated note. It takes an hour now and cannot be reconstructed later.

Working folder. Filenames and modification dates in the KCS Capital CLAUDE folder, read 17 August 2026. Dates are file dates and are not a substitute for an inventor's own account

The closest known art, by category

Not a search. A map of the ground counsel should search, with the reason each category is close and the point at which it stops short.

Category	Representative art	Where it stops
Linked timestamping and hash chains	Haber and Stornetta, How to Time-Stamp a Digital Document, 1991. US5136646A and US5136647A	Foundational for element B. A record chained to its predecessor is old art and cannot on its own support a claim
Merkle trees, blockchain and distributed ledgers	Merkle 1979 onward, and the whole distributed ledger field	Tamper evidence by tree hashing and consensus. Aimed at parties who do not trust each other, rather than at reproducing a past period on demand
Ledger databases	Azure SQL Database ledger. immudb. Amazon Quantum Ledger Database, which Amazon has closed and for which Microsoft published a migration route	The closest commercial art, and the first thing a reviewer will name. These verify by comparing a digest, not by producing the period again and comparing output
Write once storage and compliance archiving	Write once media and object lock, of the kind used for broker dealer record keeping	Makes the medium unwritable. Says nothing about which rule applied on a given day, or about admitting a correction
Temporal databases	SQL:2011 system versioned and application time period tables. Bitemporal modelling generally	Element D is standard art. This is precisely why the two dates are not claimed, and counsel should confirm that reading
Audit logging and tamper evident logs	Signed and chained application audit logs, and log integrity in security tooling	Protects a log beside the data. Here the record is the data, and the log of reads is itself a chained record

Legend. Element B is old. Element D is standard. A claim resting on either alone would not survive. The combination, and element E in particular, is where counsel should concentrate.

Where a claim would have to distinguish itself

Four candidate points, ranked by how much weight each looks able to carry. This is a founder's reading of the ground, offered to counsel as a starting position rather than as an opinion on patentability.

1 Strongest · reproduction, not verification

A ledger database proves a record is unaltered by comparing a digest it computed itself. This produces the period again, from the store, and the output matches the earlier production exactly. A reviewer can hold two files side by side without trusting either party's software.

2 Strong · correction inside an add only store

Regulated record keeping has to admit that people get things wrong six weeks later. Admitting a correction while leaving the earlier record readable and the chain sound is the part a general purpose ledger does not address.

3 Moderate · the rule version inside the chained record

Binding the dated rule version into the record that the chain protects, so a past day re-runs under its own rule and the re-run is itself provable. Each half is known. The binding may not be.

4 Weakest alone · per customer keys under the chain

Key separation per tenant is common. Whether placing it beneath the chain, so a key change does not disturb records already written, is more than an engineering choice is a question for counsel.

A question worth putting to counsel early.

If element E cannot be claimed, is the remainder worth an application at all, or is the position better held as a trade secret with the one step test used as the commercial proof? A patent publishes. A test that competitors decline to take in front of a customer may be worth more than a published specification.

What a patent buys here

A dated position a buyer's counsel can see, something to point at in a partnership negotiation, and a deterrent to a well funded copy. It also publishes the mechanism to every competitor eighteen months later.

What a trade secret buys here

The mechanism stays unpublished for as long as it holds. It protects nothing against independent invention, and it cannot be shown to a buyer as an asset.

Why both may be right

Element E claimed and published, with elements C, F and the sealing behaviour held back as secret. The held list in document 03.0 is already drawn that way.

SOURCES ON THIS PAGE

Architecture Pack. Sections 12, 14 and 28, the chain, the four things, and question 10

Eleven questions only the inventors can answer

Counsel cannot draft around these. Each one should be answered in writing, dated and signed, and returned with this record.

#	Question	Element
1	How is a record serialised for export? Field order, encoding, number and date formats, and what is left out	E
2	What is excluded from the fingerprint, and why	B, E
3	Where is the chain anchored? Per customer, per calendar month, or once across the store	B
4	What is the anchor tied to, and what stops a whole run being rebuilt from scratch	B
5	When a correction is admitted, what happens to the chain at that point exactly	C
6	What does a reader see when they ask for the record as it stood before the correction	C
7	What does a seal fix, at what moment, and how is a late arrival taken after it	A, C
8	How does a per customer key sit beneath the chain, and what does a key change do to records already written	F
9	What does the automatic comparison actually compare, and on what schedule	E
10	Which of elements A to F were conceived before 31 July 2026, and what evidence carries that date	All
11	Was any of this described to anybody outside the company before 13 August 2026, and in what setting	All

Legend. Questions 1, 2 and 9 go to the element most likely to carry the claim. Questions 10 and 11 go to the date, and are the two counsel will ask first.

An answer of 'we have not decided yet' is a real answer, and a useful one.

It tells counsel which elements are conceived and which are aspirations, and an application that claims an aspiration is worse than one that claims less.

5 How to answer them

1 Write, do not discuss

Each answer in writing, dated, and kept. A conversation with counsel is privileged but it does not carry a date the way a signed note does.

2 Name who knew what

For each element, who conceived it and roughly when. This is the raw material for the inventorship question on the next page.

3 Say what is undecided

An element still open is a reason to file narrower now and file again later, rather than a reason to wait.

SOURCES ON THIS PAGE

Architecture Pack. Section 28, the twelve questions for the architect, from which several of these are drawn

Inventorship and the chain of ownership

Question	What the folder shows	What is needed
Who are the inventors?	Not recorded anywhere in the folder	A named list, with what each person contributed to which element. Inventorship is a matter of law and getting it wrong can invalidate a patent
Are contributions from the build partner in scope?	The build agreement places the evidence store and the two dates with 4orm Finance, senior hands only, never handed over	Confirmation that nobody at Speer Technologies contributed to elements A to F. The build order was designed so the answer is no
Do advisors have assignment obligations?	An IP and invention assignment schedule exists in the advisory paperwork, and an independent contractor and advisory services agreement is on file	Confirmation that every person who has discussed the store is inside a signed assignment, and the dates of each
Does the company own what employees make?	Not visible in the folder	Employment or contractor agreements with present tense assignment language for anybody who has touched the design
Which entity files?	Alberta incorporated, with an incorporation decision memo on file	The filing entity confirmed, and a check that no earlier entity has a claim

Legend. The build split was designed so that the two layers carrying the position never leave the company. That decision, made for commercial reasons, also keeps the inventorship question simple. It is worth saying so to counsel.

Inventorship is the cheapest thing to get right now and among the most expensive to fix later.

It is a question of who contributed to the claims as they are finally written, which means it cannot be settled until the claims exist. It can be prepared for today by writing down who said what, and when.

The disclosure log, and the bar date question

Document	Dated	Carries elements	What sits behind it
Architecture pack, 21 pages	5 Aug 2026	A, B, C, D, E, F	A cover marking: Confidential, Not for distribution
Architecture pack, Speer edition	6 Aug 2026	To be confirmed	To be confirmed
What We Build, 10 pages	5 Aug 2026	A and D at outcome level only	A cover marking
Mutual NDA, 40rm and Speer	13 Aug 2026	Not applicable	Countersigned
03.1 Technology Overview	17 Aug 2026	A and D at outcome level only	Written to be safe as a public disclosure
03.2 Technical Architecture	17 Aug 2026	A and D, plus the record shape less the fingerprint fields	Released on a countersigned NDA only

Legend. Elements are lettered as on page three. A cover marking is a request. It is not the same thing as a signature.

THE ONE ITEM THAT SETS THE FILING CLOCK

The 21 page pack is dated 5 August 2026 and carries every element. The mutual NDA is dated 13 August 2026. If the pack reached any reader in the eight days between those dates, it went out with a cover marking rather than a signature behind it. Canada and the United States allow the inventor twelve months from an enabling public disclosure, which on those dates would run to August 2027. Most other jurisdictions, Europe and China among them, apply absolute novelty and allow none. **Who received the 5 August pack, on what date, and what was signed at the time.** This is question 11 on page seven and it is the first thing counsel will ask.
